# Operation **Manual**

## **SV-DA200 Series** **AC servo drive**

## Preface

Thanks for selecting SV-DA200 servo drive.

SV-DA200 servo drive series products adopt modular design with abundant functions and powerful performance. The upper PC software uses USB communication and the bus control is optional among Modbus bus, CANopen bus, EtherCAT bus, MotionNet bus and the PROFIBUS-DP bus which can be selected via extension card. Meanwhile, this product is equipped with online/offline inertia identification, gain switching, auto/manual notch filter, auto/manual vibration control filter, internal point-to-point (PTP) control, fully-closed loop control safety terminal STO, 16-bit analog input and supports multiple types of encoders, etc.

SV-DA200 drive adopts electromagnetic compatibility design to ensure strong anti-electromagnetic interference capacity while realizing low noise and weakening electromagnetic interference in the application sites.

This manual presents installation and configuration, parameters setup, fault diagnoses and daily maintenance and relative precautions to customers. Please read this manual carefully before installation to ensure SV-DA200 drive is installed and operated properly to give full play to its excellent performance.

If the product is ultimately used for military affairs or manufacture of weapon, it will be listed on the export control formulated by ***Foreign Trade Law of the People's Republic of China***. Rigorous review and necessary export formalities are needed when exported.

Our company reserves the right to update the information of our products.

Note: Models mentioned in this operation manual are standard type unless otherwise specified.

## Safety precautions

### Safety symbols:

Read manual carefully and follow the directions  
务必在阅读使用说明书后，按其步骤操作！

Disconnect all power and wait 15 min. before  
servicing. May cause electric shock.  
通电中或断电15分钟内，请勿触摸端子，有触电危险！

Don't touch heatsink. May cause burn.  
请勿触摸散热片，有烫伤危险！

Contact currents up to 0.5mA. Before use must be reliable  
grounding.  
接触电流可达0.5mA，使用前必须可靠接地！

The safety symbols are marked in the front or side of the servo drive. Users must follow these safety instructions when operating on the servo drive.

### Recycling symbol:

When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point instead of placing it in the normal waste stream.

Following safety precautions should be paid attention to before any installation, configuration, operation, maintenance and inspection:

- ◆ Check whether the AC power supply is the same as the rated voltage of the servo drive, otherwise fire, hurt, damage to the drive may occur.
- ◆ Do not connect the input power cables to the output terminals, otherwise damage to the drive may occur.
- ◆ Do not carry out any insulation and voltage withstand test to the drive directly, and do not test the control circuit of the drive by megameter.
- ◆ Connect the drive and motor as correct phase sequence, otherwise drive fault or damage may occur.
- ◆ De-couple the motor load and run the motor independently before operation to avoid accidents.
- ◆ Please ensure the drive can be disconnected from the power supply by E-switch before any operation.
- ◆ Set the corresponding parameters before operation, otherwise the drive may run abnormally or beyond the expectation because of the load.
- ◆ Only qualified electrical engineers can carry out the wiring, otherwise electric shock or fire may occur.
- ◆ Do not touch the conductive parts directly; do not connect any external cables (especially those

related to electricity) to the enclosure or short connect the external cables, otherwise electric shock or short circuit may occur.

- ◆ Rewire the drive after 15 minutes when disconnecting the power supply, otherwise electric shock may occur.
- ◆ Do ground with proper techniques because the touch current may be 0.5mA, otherwise electric shock may occur.
- ◆ Do not touch the heat sink and external braking resistor during operation, otherwise burning may occur for the hot sides.
- ◆ Do install the overcurrent protector, leakage current protector and emergency device and ensure the normal usage after wiring, otherwise electric shock, hurt and fire may occur.
- ◆ The leakage current may exceed 3.5mA during the drive running. Do ground with proper techniques and ensure the grounding resistor is less than 10Ω. The conductivity of PE earth conductor is the same as the phase conductor (with the same cross area).
- ◆ The components inside the drive contain heavy metal which should be disposed as industrial waste.

# 1 Product overview

## 1.1 Servo drive

### 1.1.1 Instruction to the drive

DA200 series servo drive (100W–55kW)			
Specification		Description	
Power supply	220V system input voltage	1P/3P AC220V(-15%)–240V(+10%) 47Hz–63Hz	
	400V system input voltage	3P AC380V(-15%)–440V(+10%) 47Hz–63Hz	
Interface	Control signal	Input	10 inputs for standard type, pulse type and CANopen bus type; 7 inputs for EtherCAT bus type; 5 inputs for MotionNet bus type (the function can be configured by relevant parameters)
		Output	6 single-end outputs for standard type, pulse type and CANopen bus type; 4 differential outputs for EtherCAT bus type; 1 single-end output for MotionNet bus type (the function can be configured by related parameters)
	Analog value	Input	3 inputs for standard type (one 16-bit, two 12-bit analog inputs), 2 inputs for others (two 12-bit analog inputs)
		Output	2 outputs (analog output)
	Pulse signal	Input	1 group (mode: open collector input or differential input)
		Output	1 group (differential outputs (A+, A-,B+, B-,Z+, Z-) or open collector outputs (A;B;Z))
	2 <sup>nd</sup> encoder	Input	Incremental encoder interface (2 <sup>nd</sup> encoder or linear encoder)
	Communication	USB	1:1 communication upper PC software (standard)
		RS485	1:n communication (standard)
		CANopen	1:n communication (optional)
		Profibus-DP	1:n communication (optional)
		EtherCAT	1:n communication (optional)
	Safety terminals	STO	Safe torque off (conform to the latest European safety standards) (optional)
Control mode		1 Position control; 2 Speed control; 3 Torque control; 4 Position/Speed mode switching; 5 Speed/Torque mode switching; 6 Position/Torque mode switching; 7 Fully-closed loop control; 8 CANopen mode; 9 EtherCAT mode; 10 MotionNet mode	

DA200 series servo drive (100W–55kW)					
Specification		Description			
Function	Position control	Control input	1. Retention pulse clearing; 2. Command pulse input disabled; 3. Electronic gear ratio switching; 4. Vibration control switching, etc		
		Control output	Positioning completion output, etc		
		Pulse input	Max. pulse input frequency	Optical coupling: differential input 4Mpps, open collector input 200kpps;	
			Pulse input mode	1. Pulse + direction; 2. CW+CCW; 3. Quadrature	
			Electric gear	1/10000–1000 times	
			Filter	1. Command smoothing filter; 2. FIR filter	
		Analog input	Torque limit command input	Can independently perform clockwise/ counterclockwise torque limit	
		Vibration control	Control 5–200Hz forward and whole machine vibration		
		Pulse output	1. Can perform arbitrary frequency division settings under the encoder resolution; 2. B phase reverse function		
	Speed control	Control input	1. Internal command speed 1; 2. Internal command speed 2; 3. Internal command speed 3; 4. Zero speed clamp, etc		
		Control output	Speed reaching, etc		
		Analog input	Speed command input	Can be speed command input after relevant setting based on analog voltage DC±10V	
			Torque limit input	Can independently arrange clockwise/ counterclockwise torque limit	
		Internal speed commands	8 step speed can be switched according to the external control input		
		ACC/DEC adjustment of speed command	ACC/DEC time setting and S curve setting		

DA200 series servo drive (100W–55kW)					
Specification		Description			
		Zero speed clamp	In the speed mode, it can set the operation mode as the speed mode and position mode		
		Speed command filter	A delay filter of analog input speed command		
		Speed command zero drift control	Zero drift control against outside interference with 0.3mV precision		
	Torque control	Control input	Zero speed clamp input, etc		
		Control output	Speed reaching, etc		
		Analog input	Torque command input	Analog torque command input, gain and polarity can be set based on analog voltage with 4.88mV precision	
			Speed limit input	Analog speed limit	
		Speed limit	Set the speed limit by parameters		
		Torque command filter	A delay filter of analog input torque command		
		Torque command zero drift control	Zero drift control against the outside interference with 4.88mV precision		
	Internal position plan	Plan bits	128 bits internal position planning, the positioning can be controlled through communication		
		Route setting	1. Position; 2. Speed; 3. ACC time; 4. DEC time; 5. Stop timer; 6. Various state output; 7. Operational mode		
		Homing	1. LS signal; 2. Z phase signal; 3. LS signal+Z phase signal; 4. Torque limit signal		
Protection	Hardware protection		Overvoltage, undervoltage, overcurrent, overspeed, overload, braking resistor overload, drive overheat, encoder fault and so on		
	Software protection		Storage fault, initialization fault, I/O distribution abnormalities and large position deviation		
	Protection and fault record		1. Record up to 10 faults 2. Can record the key parameters when fault occurs		
Environment	Operation temperature		0–45℃		
	Storage temperature		-20–80℃ (no frozen)		
	Operation/storage humidity		Operation/storage: ≤90%RH (no condensation)		
	IP degree		IP20		
	Elevation		Below 1000m altitude		
	Vibration		≤5.88m/s <sup>2</sup> , 10–60Hz(Working at the resonance point is not allowed)		

1.1.2 External appearance of the drive

◆ Standard model

◆ Models which carry extension cards with DP function

## 1.1.3 Naming of the drive

**SV-DA200-0R4-2-E0-XXXX**

①

②

③

④

⑤

⑥

⑦

Symbol	Instruction	Naming instance
①	Product category	SV: Servo system product
②	Product series	DA200: Product series
③	Power class	0R1: 100W 0R2: 200W 0R4: 400W 0R7: 750W 1R0: 1.0kW 1R5: 1.5kW 2R0: 2.0kW 3R0: 3.0kW 4R4: 4.4kW 5R5: 5.5kW 7R5: 7.5kW 011: 11kW 015: 15kW 022: 22kW 037: 37kW 045: 45kW 055: 55kW
④	Input voltage class	2: 220VAC; 4: 400VAC
⑤	Servo type	E: Pulse type S: Standard C: CANopen bus type P: PROFIBUS-DP bus type N: EtherCAT bus type M: MotionNet bus type K: Customized
⑥	Encoder type	0: Photoelectric encoder <sup>(1)</sup> 7: Rotary transformer
⑦	Lot no.	Manufacturer lot no. used for differentiating models with special functions. Lot no. is the default one.

Remark:

<sup>(1)</sup>: Photoelectric encoder here means 2500-PPR standard incremental type, 17-bit single turn/multi-turn absolute and 23-bit multi-turn absolute (the same below).

Function difference between different machine types:

Small power range: 100W–5.5kW												
Drive type	Symbol	Pulse input	16-bit analog input	2 <sup>nd</sup> encoder	STO	RS485	CAN open	PROFIBUS-DP	EtherCAT	Motion Net	Photoelectric encoder	Rotary transformer
Pulse type	E0	○	×	○	×	○	×	×	×	×	○	×

SV-DA200-015-4	Three phase 400	31	15	50	F2
SV-DA200-022-4	Three phase 400	45.4	22	66	G
SV-DA200-037-4	Three phase 400	76.3	37	90	G
SV-DA200-045-4	Three phase 400	92.8	45	112	H
SV-DA200-055-4	Three phase 400	113.4	55	134	H

## 1.2 Servo motor

### 1.2.1 Nameplate of the motor

**Note:** “No. 3010004” in the nameplate is the motor model code (motor code for short). Please input this code into servo parameter P0.00 correctly (P0.00 is long parameter which can be set via keypad. See details at chapter 5.2.1 (8), otherwise, the servo system may not operate normally and major fault may occur to the drive and motor.

### 1.2.2 Naming of the servo motor

**SV-ML06-0R4G-2-4A0-XXXX**

①      ② ③ ④                      ⑤      ⑥      ⑦      ⑧ ⑨ ⑩                      ⑪

Symbol	Instruction	Naming instance
①	Product category	SV: Servo system product
②	Product series	M: M series C: C series S: S series
③	Inertial class	L: Small inertia general servo motor M: Medium inertia general servo motor H: Large inertia general servo motor
④	Base no.	04: 40mm <sup>(2)</sup> 06: 60mm 08: 80mm 11: 110mm 13: 130mm 18: 180mm 20: 200mm 26: 263mm
⑤	Rated power	0R1: 100W 0R2: 200W 0R4: 400W

Symbol	Instruction	Naming instance
		0R7: 750W 0R8: 800W/850W 1R0: 1.0kW 1R2: 1.2kW 1R3: 1.3kW 1R5: 1.5kW 1R8: 1.8kW 2R0: 2.0kW 3R0: 3.0kW 4R4: 4.4kW 5R5: 5.5kW 7R5: 7.5kW 011: 11kW 015: 15kW 022: 22kW 037: 37kW 045: 45kW 055: 55kW .....
⑥	Rated speed	A: 1000rpm B: 1500rpm E: 2000rpm F: 2500rpm G: 3000rpm
⑦	Voltage class	2: 220VAC 4: 380VAC
⑧	Encoder type	1: 2500-PPR standard incremental type 3: 17-bit single-turn absolute value <sup>(1)</sup> 4: 17-bit multi-turn absolute value 7: Rotary transformer 9: 23-bit multi-turn absolute value
⑨	Shaft end connection	A: solid with threaded hole and key (standard) B: Solid optical axis
⑩	Optional part	0: with oil seal but no brake 1: without oil seal or brake <sup>(3)</sup> 2: with oil seal and permanent magnet brake 3: without oil seal but with permanent magnet brake <sup>(3)</sup> 4: with oil seal and electromagnetic brake 5: without oil seal but with electromagnetic brake <sup>(3)</sup>
⑪	Lot no.	Manufacturer lot no. <sup>(4)</sup>

**Remark:**

- (1): 17-bit absolute single turn motor belongs to a separate series and its dimension and parameters are different. Only electromagnetic brake is used. Please pay attention to corresponding series when selecting models;
- (2): 40-base motor, only supports 2500-PPR and 17-bit absolute encoder;
- (3): Non-stock up model, the ordering cycle will be delayed for 3–5 days;
- (4): No need to fill in for the first-time model selection by customers;
- In addition, the non-17 bit single-turn absolute motor with 40 or 60 base supports permanent magnet brake only.

**1.3 Cables****1.3.1 Nameplate of cables****1.3.2 Naming of the power cables**

## 2.2 Drive installation

### 2.2.1 Installation mode

- 1) Base installation (there is a  $\Phi 5$  installation hole at the lower left corner and upper right corner of the rear board respectively)

- 2) Bracket installation (the installation bracket is optional)

**2.2.2 Installation space and direction**

Please install the servo drive vertically and keep enough installation space for good ventilation. Install fans if necessary to ensure the temperature inside the control cabinet is lower than 45 °C.

1) Single drive installation

2) Multiple drives installation

## 2.3 Motor dimension

**Note:** As motor structure and dimension may vary slightly with design modification, for those who are sensitive to the installation length of motor, please confirm the installation length with our business staff before ordering.

### 2.3.1 Outline and installation dimension for 40 base (mm)

Motor model (2500-PPR/multi-turn absolute value)	L(mm)	
	W/o brake	Permanent magnet brake
SV-ML04-0R1G-2-□A□	90	124

Motor model (17-bit single-turn encoder)	L(mm)	
	W/o brake	Electromagnetic brake
SV-ML04-0R1G-2-3A□	90.3	123

2.3.2 Outline and installation dimension for 60 base (mm)

Motor model (2500-PPR/multi-turn absolute value/rotary transformer)	L(mm)	
	W/o brake	Permanent magnet brake
SV-ML06-0R2G-2-□A□	116	164

## 2.4 Motor installation

- ◆ Do not pull the motor leads or output shaft during fetching and moving the motor;
- ◆ Do not beat or hammer during the motor assembly to avoid damage to the encoder or shafts;
- ◆ Please wipe the slushing oil on the motor shaft before using.

## 2.5 Technical parameters of servo motor

### 2.5.1 Motor specification (2500-PPR/multi-turn absolute /rotary transformer)

## 3 Wiring instruction

### 3.1 System wiring

- ◆ Check to ensure the input power supply indicated on the nameplate is the same as that of the grid before connecting the input power supply of the drive.
- ◆ The electromagnetic contactor is used to switch on/off the power supply of the main circuit of the servo drive. Do not use it to start/stop the servo drive.
- ◆ In the above figure, the external regenerative brake resistor is connected, and the short connection wire between B2 and B3 should be removed, refer to chapter 3.2 for details. The external regenerative brake resistor must be installed on flame-resistance material which has good cooling effect eg metal.

### 3.1.1 Requirements on input power cable

The dimension of input power cable shall comply with local regulations.

- The input power cable must be able to withstand corresponding load current.
- The max rated temperature margin of input power cable should not be lower than 70°C under continuous operation.
- See IEC/EN 61800-3:2004 for EMC requirements.

It is recommended to use shielded four-core cable for input cable

In order to protect the conductors, the cross section of shielded cable must be the same as that of the phase conductor when the shielded cable and phase conductor use the same material, which will help reduce grounding resistor to improve impedance continuity.

In order to suppress the emission and transmission of RF, the conductivity of shielded cable must be at least 1/10 of phase conductor conductivity. The coverage rate of shielded layer must be above 85% at least.

### 3.1.2 Requirements on control cable

All the analog control cables and the cables used for frequency input must use shielded cable. The analog signal cable uses shielded twisted pair (figure a). Each signal adopts a pair of independent shielded twisted pairs. Different analog signals cannot use the same ground wire.

For low voltage digital signals, it is recommended to use double-layer shielded cables, single-layer shielded pairs or shieldless pairs (figure b), however, for pulse input signals, only shielded cables can be used.

Communication cables must use shielded twisted pairs.

## 3.1.3 Cable diameter of main circuit

SV-DA200-045-4	FLT-P04250L-B
SV-DA200-055-4	

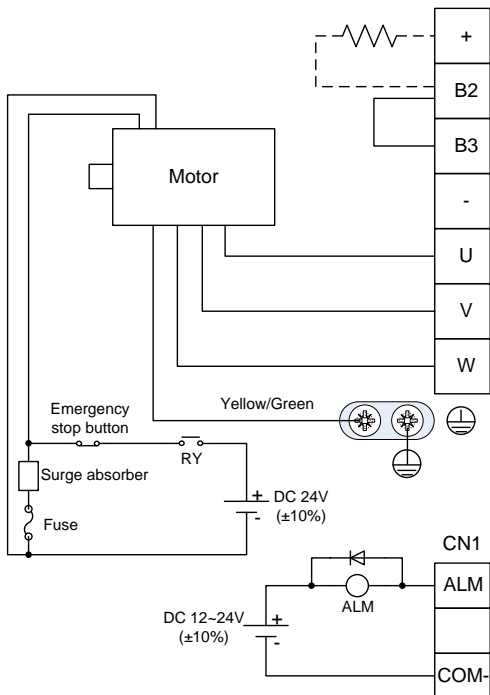

**Note:** The EMI filter models in the table are the models of our company and they are used for power input terminal.

### 3.2 Terminal wiring of the main circuit

#### 3.2.1 Wiring diagram of single phase 220V (small power range: 100W–5.5kW)

- The user is required to make this emergency stop protection circuit.
- Add surge absorbing devices on both ends of the electromagnetic contactor winding.
- The power input voltage range: AC 220V(-15%)~240V(+10%)
- Connect main circuit to terminal L1 and terminal L3.
- Note: Please use 3-phase input power for the drive of 1.5kW and above.

- Do not disconnect the short connection cable between B2 and B3, unless external regenerative brake resistor is used;
- When external regenerative brake resistor is used, disconnect the short connection cable between B2 and B3 and make connection based on the dotted lines in the diagram.
- Connect output U, V and W to the drive according to the motor cable phase sequence of servo motor, wrong phase sequence will cause drive fault
- Be sure to ground the servo drive to avoid accident of electrical shock.
- The electromagnetic brake uses 24V power supply which should be provided by the user. Moreover, it must be isolated from the DC12-24V power supply which is used by the control signal.
- Pay attention to the connection of the freewheeling diode. Reversed polarity may damage the drive.

**3.2.2 Wiring diagram of three phase 220V/400V (small power range: 100W–5.5kW)**

- The user is required to make this emergency stop protection circuit.
- Add surge absorbing devices on both ends of the electromagnetic contactor winding.
- Input voltage range of 220V system: AC 220V(-15%)~240V(+10%)
- Input voltage range of 400V system: AC 380V(-15%)~440V(+10%)

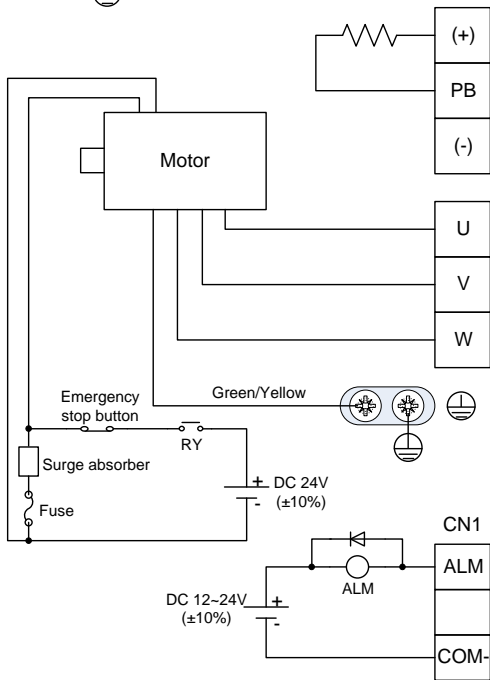

- Do not disconnect the short circuit wire between B2 and B3 unless an external regenerative braking resistor is used.
- When an external regenerative braking resistor is used, disconnect the short circuit wire between B2 and B3, and connect it according to the dotted line in the figure.
- Connect the output U, V and W of the drive to the servo motor correctly according to the phase sequence of the motor cable of the servo motor. Wrong phase sequence will cause drive fault.
- Be sure to ground the servo drive to avoid accident of electrical shock.
- The electromagnetic brake uses 24V power supply which should be provided by the user. Moreover, it must be isolated with the DC12-24V power supply which is used by the control signal.
- Pay attention to the connection of the freewheeling diode. Reversed polarity may damage the drive.

**3.2.3 Wiring diagram of three phase 400V (medium power range: 7.5kW–55kW)**

- The user is required to make this emergency stop protection circuit.
- Add surge absorbing devices on both ends of the electromagnetic contactor winding.
- Input voltage range of 400V system: AC 380V(-15%)~440V(+10%)

- It is necessary to connect external regenerative brake resistor between terminal (+) and PB
- Connect output U, V and W to the drive according to the motor cable phase sequence of servo motor, wrong phase sequence will cause drive fault
- Be sure to ground the servo drive to avoid accident of electrical shock.
- The electromagnetic brake uses 24V power supply which should be provided by the user. Moreover, it must be isolated from the DC12-24V power supply which is used by the control signal.
- Pay attention to the connection of the freewheeling diode. Reversed polarity may damage the drive.

### 3.3 Wiring of motor power cables

#### 3.3.1 2500-PPR 40/60/80-base 100W–750W motor power cable

Wiring relation

Definition	X1	X2	Core wire color
W	X1.7	X2.3	Brown
V	X1.6	X2.1	Red
U	X1.5	X2.2	Blue
PE	Ground terminal	X2.4	Yellow/green
/	X1.4	/	/
/	X1.3	Short connect to X1.2	
/	X1.2	Short connect to X1.3	
/	X1.1	/	/

#### 3.3.2 17-bit or 23-bit 40/60/80-base 100W–750W motor power cable

Wiring relation

Definition	X1	X2	Core wire color
W	X1.7	X2.1	Brown
V	X1.6	X2.3	Red
U	X1.5	X2.4	Blue
PE	Ground terminal	X2.2	Yellow/green
/	X1.4	/	/
/	X1.3	Short connect to X1.2	
/	X1.2	Short connect to X1.3	
/	X1.1	/	/

#### 3.3.3 110/130-base 800W–1.5kW (220V) and 1kW–3kW (380V) motor power cable (except 130 base 17-bit single-turn with brake)

Wiring relation

Definition	X1	X2	Core wire color
W	X1.7	X2.4	Brown
V	X1.6	X2.3	Red
U	X1.5	X2.2	Blue
PE	Ground terminal	X2.1	Yellow/green
/	X1.4	/	/
/	X1.3	Short connect to X1.2	
/	X1.2	Short connect to X1.3	
/	X1.1	/	/

**3.3.4 130/180-base 2kW–4.4kW (220V) and 4.4kW–7.5kW (380V) motor power cable (except for 130 base 17-bit single-turn with brake)**

Wiring relation

Definition	X2	Core wire color
W	X2.4	Brown
V	X2.3	Red
U	X2.2	Blue
PE	X2.1	Yellow/green

**3.3.5 200/260-base 11kW–55kW (380V) motor power cable**

**3.3.6 130-base 17-bit single-turn motor power cable with brake**

Wiring relation

Definition	X1	X2	Core wire color
W	X1.7	X2.4	Brown
V	X1.6	X2.3	Red
U	X1.5	X2.2	Blue
PE	Ground terminal	X2.1	Yellow/green
/	X1.4	/	/
/	X1.3	Short connect to X1.2	
/	X1.2	Short connect to X1.3	
/	X1.1	/	/
Brake 1	Y shape terminal	X2.6	Red
Brake 2	Y shape terminal	X2.7	Black

### 3.4 Control I/O-CN1 terminal layout

CN1 plug pin layout

CN1 plug signal layout

**Remark:** This is the interface definition for standard model; refer to chapter 4 for terminal function and application. See corresponding operation guide for EtherCAT bus type.

### 3.5 Wiring of encoder-CN2 terminals

#### 3.5.1 CN2 terminals

CN2 terminal function			
Pin	Name	Function	Remark
1	V+ /SD+	Parallel encoder V+/Serial encoder data+	Different encoders use different cables
2	W+	Signal of parallel encoder W+	
3	A+	Signal of parallel encoder A+	
4	A-	Signal of parallel encoder A-	
5	5V	Encoder power supply	
6	U+	Signal of parallel encoder U+	
7	V- /SD-	Parallel encoder V-/Serial encoder data-	
8	W-	Signal of parallel encoder W-	
9	B-	Signal of parallel encoder B-	
10	B+	Signal of parallel encoder B+	
11	U-	Signal of parallel encoder U-	
12	GND	Power ground	
13	Z-	Signal of parallel encoder Z-	
14	Z+	Signal of parallel encoder Z+	
15	-	Unused	

3.5.2 2500-PPR 40, 60, 80-base encoder cable

Wiring relation

Signal	X1	X2	Core wire structure
V+	X1.1	X2.1	Twisted pair
V-	X1.7	X2.7	
W+	X1.2	X2.2	Twisted pair
W-	X1.8	X2.8	
A+	X1.3	X2.3	Twisted pair
A-	X1.4	X2.4	
U+	X1.6	X2.6	Twisted pair
U-	X1.11	X2.11	
B-	X1.9	X2.9	Twisted pair
B+	X1.10	X2.10	
Z-	X1.13	X2.13	Twisted pair
Z+	X1.14	X2.14	
5V	X1.5	X2.5	Twisted pair
GND	X1.12	X2.12	
PE	Steel casing	Steel casing	

3.5.3 2500-PPR 110, 130, 180, 200 base encoder cable

Wiring relation

Signal	X1	X2	Core wire structure
V+	X1.1	X2.11	Twisted pair
V-	X1.7	X2.14	
W+	X1.2	X2.12	Twisted pair
W-	X1.8	X2.15	
A+	X1.3	X2.7	Twisted pair
A-	X1.4	X2.4	
U+	X1.6	X2.10	Twisted pair
U-	X1.11	X2.13	
B-	X1.9	X2.8	Twisted pair
B+	X1.10	X2.5	
Z-	X1.13	X2.9	Twisted pair
Z+	X1.14	X2.6	
5V	X1.5	X2.2	Twisted pair
GND	X1.12	X2.3	
PE	Steel casing	Steel casing	

3.5.4 17-bit and 23-bit 40, 60, 80 base encoder cable

Wiring relation

Signal	X1	X2	Core wire structure
SD+	X1.1	X2.1	Twisted pair
SD-	X1.7	X2.2	
5V	X1.5	X2.3	Twisted pair
GND	X1.12	X2.4	
VB-5V	/	X2.5	Twisted pair
VB-GND	/	X2.6	
PE	Steel casing	Steel casing	Weaving

3.5.5 17-bit and 23-bit 110, 130, 180, 200 base encoder cable

Wiring relation

Signal	X1	X2	Core wire structure
SD+	X1.1	X2.2	Twisted pair
SD-	X1.7	X2.3	
5V	X1.5	X2.4	Twisted pair
GND	X1.12	X2.5	
VB-5V	/	X2.6	Twisted pair
VB-GND	/	X2.7	
PE	Steel casing	X2.1	Weaving

3.5.6 Rotary transformer encoder cable

Wiring relation

Signal	X1	X2	Core wire structure
SIN+	X1.1	X2.6	Twisted pair
SIN-	X1.7	X2.7	
COS+	X1.2	X2.5	Twisted pair
COS-	X1.8	X2.4	
R+	X1.5	X2.2	Twisted pair
R-	X1.12	X2.3	
PE	Steel casing	X2.1	Weaving

### 3.6 Wiring of 485/CAN-CN3 terminals

CN3 terminal function			
Pin	Name	Function	Remark
1	GND_CAN	CAN chip power GND	485 and CAN use the same interface and each signal has two pins for multiple networking.
2	GND_485	485 chip power GND	
4	RS485+	RS485 data +	
5	RS485-	RS485 data -	
7	CAN_L	CAN data -	
8	CAN_H	CAN data +	
3, 6	-	Unused	

**Note:** EtherCAT bus-type drive, this port is standard network cable port definition, namely pin 1, 2, 3 and 6 correspond to Tx+, Tx-, Rx+ and Rx- respectively.

### 3.7 Wiring of USB-CN4 terminals

CN4 USB port function			
Pin	Name	Functions	Remark
2	D-	Data -	The standard cable for USB micro to USB-A conversion is available.
3	D+	Data +	
5	GND	Signal ground	
1, 4	-	Unused	

### 3.8 2<sup>nd</sup> encoder and STO-CN5 terminal wiring

#### 3.8.1 Terminal interface and definition of small power range (100W–5.5kW)

Small power range CN5 port function			
Pin	Name	Function	Remark
1	HWBB1+	Safety input 1+	Connect to linear encoder or 2 <sup>nd</sup> encoder
2	HWBB2+	Safety input 2+	
3	EXA+	Linear encoder (2 <sup>nd</sup> encoder) A+	
4	EXA-	Linear encoder (2 <sup>nd</sup> encoder) A-	
5	EX5V	Power supply +5V	
6	EDM+	Safety monitoring output +	
7	HWBB1-	Safety input 1-	
8	HWBB2-	Safety input 2-	
9	EXB-	Linear encoder (2 <sup>nd</sup> encoder) B-	
10	EXB+	Linear encoder (2 <sup>nd</sup> encoder) B+	
11	EDM-	Safety monitoring output -	
12	EX0V	Power ground, be connected with internal GND	
13	EXZ-	Linear encoder (2 <sup>nd</sup> encoder) Z-	
14	EXZ+	Linear encoder (2 <sup>nd</sup> encoder) Z+	
15	-	Unused	

#### 3.8.2 Terminal interface and definition of medium power range (7.5kW–55kW)

CN5 terminal function table			
Pin no.	Name	Function	Remark
1	EXA+	Linear encoder (2 <sup>nd</sup> encoder) A+	Connect to linear encoder
2	EXA-	Linear encoder (2 <sup>nd</sup> encoder) A-	

CN5 terminal function table			
Pin no.	Name	Function	Remark
3	EXB+	Linear encoder (2 <sup>nd</sup> encoder) B+	or 2 <sup>nd</sup> encoder
4	EXB-	Linear encoder (2 <sup>nd</sup> encoder) B-	
5	EXZ+	Linear encoder (2 <sup>nd</sup> encoder) Z+	
6	EXZ-	Linear encoder (2 <sup>nd</sup> encoder) Z-	
7, 9	EX5V	Power +5V	
8, 10	EX0V	Power GND, connected to internal GND	
11	HWBB1+	Safety input 1+	
12	HWBB1-	Safety input 1-	
13	EDM+	Safety monitoring input+	
14	EDM-	Safety monitoring input-	
15	HWBB2+	Safety input 2+	
16	HWBB2-	Safety input 2-	
17	OC_EXZ	Z phase open collector input	
18	OC_EXB	B phase open collector input	
19	OC_EXA	A phase open collector input	
20	-	Unused	

### 3.9 Wiring of PROFIBUS-DP terminals

DP plug pin layout

DP plug signal layout

DP port function			
Pin	Name	Function	Remark
3	B-Line	Data +	DP standard terminals and pin connection; this terminal is on extension card
4	RTS	Request sending	
5	GND_BUS	Isolation ground	
6	+5V_BUS	5V isolation power	
8	A-Line	Data -	
1, 2, 7, 9	-	Unused	

### 3.10 Wiring of motor temperature resistor-CN7 terminal in medium power range (7.5kW–55kW)

Function of CN7 port			
Pin no.	Name	Function	Remark
1	T1	KTY84-1	Support KTY84 only
2	T2	KTY84-2	

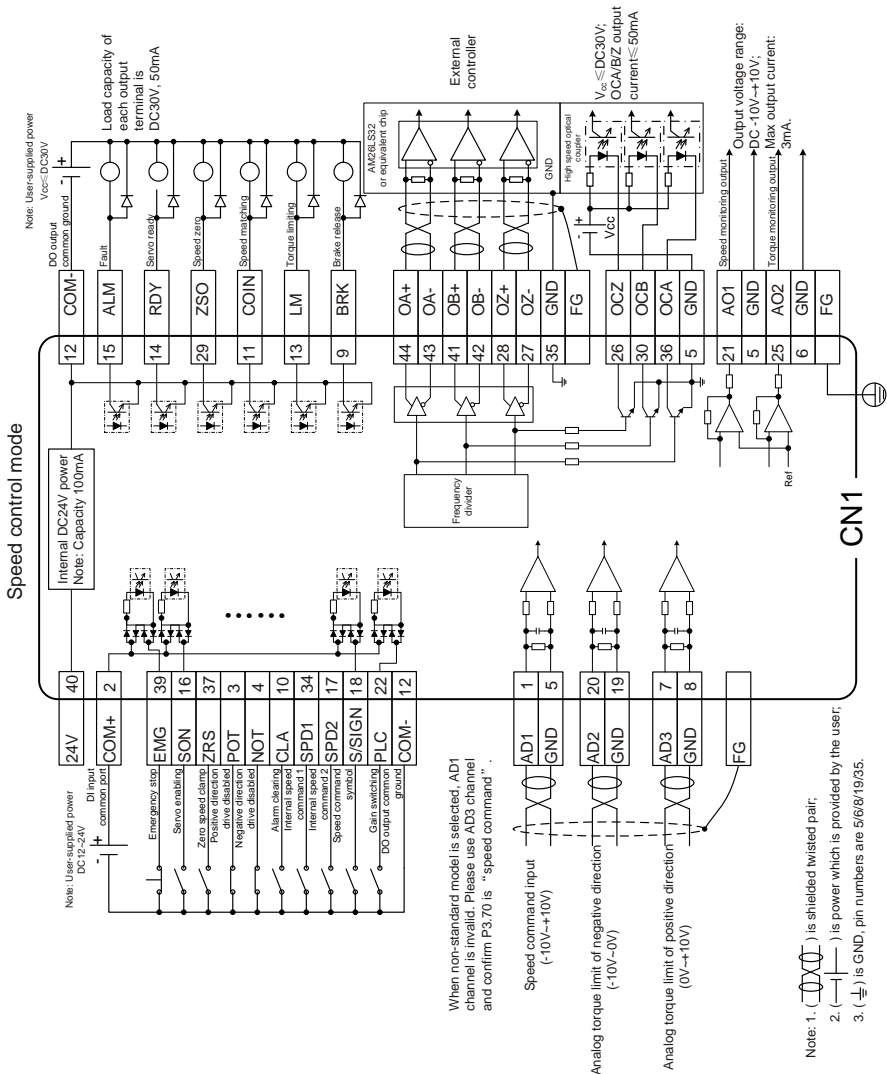

**Note:** The motor temperature sampling function is turned off by default. Set P4.45 [Temperature protection threshold of medium-power motor] to a non-zero value. The value of current temperature can be read via R0.60 [Temperature of medium-power motor].

# 4 Control mode applications

## 4.1 Standard wiring of the position mode

### 4.2 Standard wiring of the speed mode

### 4.3 Standard wiring of the torque mode

## 4.4 CN1 function instruction

### 4.4.1 Pins of CN1 terminal

CN1 plug pin layout

CN1 plug signal layout

### 4.4.2 Definition of CN1 terminals

Pin	Sign	Function	Pin	Sign	Function
1	AD1	Analog input 1	23	PULS+	Differential command pulse +
2	COM+	DI input common port	24	PULS-	Differential command pulse -
3	DI7	Digital input 7	25	AO2	Analog output 2
4	DI8	Digital input 8	26	OCZ	Open collector output of Z phase
5	GND	Analog signal ground	27	OZ-	Differential output - of Z phase
6	GND	Analog signal ground	28	OZ+	Differential output + of Z phase
7	AD3	Analog input 3	29	DO4	Digital output 4
8	GND	Analog signal ground	30	OCB	Open collector output of B phase
9	DO5	Digital output 5	31	OCS	Open collector command direction
10	DI3	Digital input 3	32	SIGN+	Differential command direction +
11	DO3	Digital output 3	33	SIGN-	Differential command direction -
12	COM-	DO output common ground	34	DI5	Digital input 5
13	DO6	Digital output 6	35	GND	Analog signal ground
14	DO1	Digital output 1	36	OCA	Open collector output of A phase
15	DO2	Digital output 2	37	DI2	Digital input 2
16	DI1	Digital input 1	38	OCP	Open collector command pulse
17	DI6	Digital input 6	39	DI4	Digital input 4
18	DI9	Digital input 9	40	24V	Internal 24V power supply
19	GND	Analog signal ground	41	OB+	Differential output + of B phase
20	AD2	Analog input 2	42	OB-	Differential output - of B phase
21	AO1	Analog output 1	43	OA-	Differential output - of A phase
22	DI10	Digital input 10	44	OA+	Differential output + of A phase

#### 4.4.3 Power supply signal

Sign	Pin no.	Name	Function
24V	40	Internal 24V power supply	COM- is the ground terminal of the 24V power. Its capacity is 100mA. If the actual load is higher than this value, the user shall provide the power supply by themselves.
GND	5, 6, 8, 19, 35	Signal ground	The ground of the internal power supply (except the 24V power supply) of the servo drive, it is also the ground of the phase A/B/Z open-collector signal of the encoder and the analog output signal. It is isolated from COM-.
COM+	2	DI input common port	<ul style="list-style-type: none"> <li>● If DI is active-low (0V), COM+ connects to internal 24V power (pin 40) or external DC power (12V–24V);</li> <li>● If DI is active-high (12V–24V), COM+ connects to the reference ground of corresponding signal.</li> </ul>
COM-	12	DO output common ground	<ul style="list-style-type: none"> <li>● Local 24V power ground</li> <li>● If external DC power 12V–24V is used, power 0V is connected to this terminal.</li> </ul>
FG	Enclosure	Enclosure ground	The enclosure of CN1 terminal is connected with the enclosure of the drive

#### 4.4.4 Configuration table for different digital modes

Symbol	Pin no.	Name	Position mode			Speed mode		
			Default value	Mark	Function name	Default value	Mark	Function name
DI1	16	Digital input 1	0x003	SON	Servo enabling	0x003	SON	Servo enabling

#### 4.4.4.1 Function description of the digital input:

Signal name	Sign	Function number	Available mode		
Positive direction drive disabled	POT	0x01	P	S	T
Negative direction drive disabled	NOT	0x02	P	S	T

This function input is the drive prohibition against positive/negative direction. The concrete action is related to the setting of P3.40 [travel limit switch setting]:

When P3.40 is set to 0 and positive direction input is disabled, the motor stops at the current position, only negative direction command input can be accepted. If the negative direction drive input is disabled, the motor stops at the current position, only positive direction command input can be accepted.

P3.40 is 1, the function is invalid;

P3.40 is 2, and prohibition of positive/negative drive input is valid, the drive alarms.

Signal name	Sign	Function number	Available mode		
Servo enabling	SON	0x03	P	S	T

This function is the control signal of the servo enabling/disabling.

If it is valid, the drive will provide power to the motor; if invalid, the drive will cut off connection.

Signal name	Sign	Function number	Available mode		
Alarm clearing	CLA	0x04	P	S	T

This function is the control signal of alarm clearing when the drive alarms.

Some alarms cannot be cleared by this function. Please refer to chapter 10.4 for detailed information.

Signal name	Sign	Function number	Available mode		
Control mode switching	MCH	0x05	P	S	T

This function is the control signal of mode switching when P0.03 is 3, 4 and 5.

When the control mode is 0, 1, 2, 6 and 7 the function input is invalid.

Signal name	Sign	Function number	Available mode		
Gain switching	PLC	0x06	P	S	T

This function is the control signal of 1<sup>st</sup> and 2<sup>nd</sup> gain switching.

Signal name	Sign	Function number	Available mode		
Retention pulse clearing	RPC	0x07	P		
<p>This function is the control signal of retention pulse clearing and the detailed operation is relative to the setting of P3.45.</p> <p>P3.45=0 means electrical level clear. When the digital input is valid, retention pulse will be 0; P3.45=1 means rising edge clear. When the digital input triggers retention pulse clearing from the edge of 0→1, only clear once.</p>					

Signal name	Sign	Function number	Available mode		
Command pulse disabled	PLL	0x08	P		
<p>This function is the control signal of stopping receiving the command pulse and the detailed operation is relative to the setting of P3.44.</p> <p>P3.44 is 0, the function is valid and when P3.44 is 1, the function is invalid.</p>					

Signal name	Sign	Function number	Available mode		
Torque limit switching	TLC	0x09	P	S	
<p>This function is the control signal of 1<sup>st</sup> and 2<sup>nd</sup> torque limit switching.</p> <p>Please refer to the instruction of P0.09.</p>					

Signal name	Sign	Function number	Available mode		
Internal speed command 1	SPD1	0x0A		S	T
Internal speed command 2	SPD2	0x0B		S	T
Internal speed command 3	SPD3	0x0C		S	

There are 1–8 signal selections for the internal speed command and 1–4 for the internal speed limit.

Control mode	P0.40 setting value	SPD3	SPD2	SPD1	Parameters and setting value
Speed mode	0	0	0	0	P0.46 internal speed 1
		0	0	1	P0.47 internal speed 2
		0	1	0	P0.48 internal speed 3
		0	1	1	P0.49 internal speed 4
		1	0	0	P0.50 internal speed 5
		1	0	1	P0.51 internal speed 6
		1	1	0	P0.52 internal speed 7
		1	1	1	P0.53 internal speed 8
Torque mode	0	0	0	0	P0.46 speed limit 1
		0	0	1	P0.47 speed limit 2
		0	1	0	P0.48 speed limit 3
		0	1	1	P0.49 speed limit 4

Signal name	Sign	Function number	Available mode		
Zero speed clamp	ZRS	0x0D		S	T
<p>This function serves as the control signal of zero speed clamp, refer to P0.58 for detailed information.</p>					

Signal name	Sign	Function number	Available mode		
Speed command sign	S-SIGN	0x0E		S	
This function is the sign selection of speed command input in the speed control mode. If P0.41 is 1, the input function is valid, and when the setting is 0, the function is invalid.					

Signal name	Sign	Function number	Available mode		
Torque command sign	T-SIGN	0x0F			T
This function is the sign selection of torque command input in the torque control mode. If P0.61 is 1, the input function is valid, and when the setting is 0, the function is invalid.					

Signal name	Sign	Function number	Available mode		
Internal position command 1	POS1	0x10	P		
Internal position command 2	POS2	0x11	P		
Internal position command 3	POS3	0x12	P		
Internal position command 4	POS4	0x13	P		
Internal position command 5	POS5	0x20	P		
Internal position command 6	POS6	0x21	P		
Internal position command 7	POS7	0x22	P		

These functions are the selections of 0–127 in the PTP (point-to-point) control mode. It has the same function with P5.20 and is valid when P0.20 is 2.

The combination of 7 digital inputs is used to select the different PTP position of PtP0.00–PtP2.55 and the corresponding target speed, ACC/DEC time and the delay time of P5.21–P5.68.

Control mode	POS7	POS6	POS5	POS4	POS3	POS2	POS1	Parameters and setting value
Position mode	0	0	0	0	0	0	0	PtP0.01[0 <sup>th</sup> position]
	0	0	0	0	0	0	1	PtP0.03[1 <sup>st</sup> position]
	0	0	0	0	0	1	0	PtP0.05[2 <sup>nd</sup> position]
	0	0	0	0	0	1	1	PtP0.07[3 <sup>rd</sup> position]
	0	0	0	0	1	0	0	PtP0.09[4 <sup>th</sup> position]
	0	0	0	0	1	0	1	PtP0.11[5 <sup>th</sup> position]
	0	0	0	0	1	1	0	PtP0.13[6 <sup>th</sup> position]
	0	0	0	0	1	1	1	PtP0.15[7 <sup>th</sup> position]
	0	0	0	1	0	0	0	PtP0.17[8 <sup>th</sup> position]
	0	0	0	1	0	0	1	PtP0.19[9 <sup>th</sup> position]
	0	0	0	1	0	1	0	PtP0.21[10 <sup>th</sup> position]
	0	0	0	1	0	1	1	PtP0.23[11 <sup>th</sup> position]
	0	0	0	1	1	0	0	PtP0.25[12 <sup>th</sup> position]
	x	x	x	x	x	x	x	xxx
1	1	1	1	1	1	0	PtP2.53[126 <sup>th</sup> position]	
1	1	1	1	1	1	1	PtP2.55[127 <sup>th</sup> position]	

Signal name	Sign	Function number	Available mode		
External fault	EXT	0x14	P	S	T
This function is the signal of external input fault alarm.					

If the digital input is valid, the drive will report Er10-3 and stop.

Signal name	Sign	Function number	Available mode		
Inertia ratio switching	JC	0x15	P	S	T

This function is the control signal of inertia ratio switching between 1<sup>st</sup> inertia ratio and 2<sup>nd</sup> inertia ratio. When the digital input is valid, the internal software uses P1.02; and when invalid, use P1.01.

Signal name	Sign	Function number	Available mode		
Emergency stop	EMG	0x16	P	S	T

This function is the control signal of emergency stop. If P3.41 is set to 0 and when the digital input is valid, the drive will stop to report Er10-4.

Signal name	Sign	Function number	Available mode		
HOME switch input	HOME	0x17	P		

This function is the input signal of HOME SWITCH. When the drive carries out HOME action, in some HOME mode, if the digital input is detected to be valid, HOME is finished. Refer to P5.10 for information.

Signal name	Sign	Function number	Available mode		
HOME trigger	HTRG	0x18	P		

This function is the trigger control signal of HOME function, and the rising edge is valid. The digital input function has the same function with P5.15.

Signal name	Sign	Function number	Available mode		
Molecule 1 of electric gear ratio	SC1	0x19	P		
Molecule 2 of electric gear ratio	SC2	0x1A	P		

The function is the selection signal of the electric gear ratio, up to 4 groups of electric gears can be switched. Before using the function, it is necessary to set P0.22 to 0 and then set different electric gear ratio (P0.25–P0.29).

**Note:** If the electric gear is switched by digital value, it is necessary to set P4.10 to 0.

SC1	SC2	Electric gear ratio	
		Molecule	Denominator
0	0	P0.25	P0.26
1	0	P0.27	P0.26
0	1	P0.28	P0.26
1	1	P0.29	P0.26

Signal name	Sign	Function number	Available mode		
PTP control trigger	TRIG	0x1B	P		

In the PTP control mode, it needs to be used with internal position command 1–4. During using, select the target step by the internal position command selection 1–4, and then trigger the switching action selected by target step via the rising edging of this digital value.

Signal name	Sign	Function number	Available mode		
Vibration control switching input	VS-SEL	0x1C	P		
The function is the control signal of 1 <sup>st</sup> and 2 <sup>nd</sup> vibration control frequency. When the digital input is valid, the internal software uses P1.38; when invalid, use P1.36.					

Signal name	Sign	Function number	Available mode		
Fast stop	Q-STOP	0x1D	P	S	T
This function is the control signal of the fast stop of external control. When the digital input is valid, the motor decelerates to 0 from current speed at the curve set by P0.69; when the input is invalid, the motor will restore to the operation state before stop.					

Signal name	Sign	Function number	Available mode		
PTP control stop	PTP-ST	0x1E	P		
This function is the control signal of stopping PTP operation in the PTP control mode. In the bus control mode, it has the same function with P5.20 when it is 2048.					

Signal name	Sign	Function number	Available mode		
Absolute position clearing	PCLR	0x1F	P		
This function is used to clear the multi-turn absolute encoder. When this digital input is valid, the multi-turn data of the encoder will be cleared while the single-turn data remains unchanged, however, the absolute position feedback of the system will be cleared.					

Signal name	Sign	Function number	Available mode		
Forward jogging	FJOG	0x23	P		
This function is forward jogging. When this digital input is valid, forward jogging operation will be applied.					

Signal name	Sign	Function number	Available mode		
Reverse jogging	RJOG	0x24	P		
This function is reverse jogging. When this value is valid, reverse jogging operation will be applied.					

Signal name	Sign	Function number	Available mode		
High/low speed switching of jogging	JOGC	0x25	P		
This function is high/low speed switching of jogging. When this digital input is valid, high speed jogging will be applied.					

Signal name	Sign	Function number	Available mode		
JOG function of the terminal	DJOG	0x2C	P		
When this digital input is valid, JOG function of the terminal is valid.					

Signal name	Sign	Function number	Available mode		
Gantry synchronization input clear	GIN	0x2D	P		
When this digital input is valid, gantry synchronous is removed.					

Signal name	Sign	Function number	Available mode		
Master gantry synchronization alignment sensor	GSM	0x2E	P		
Master gantry synchronization alignment sensor					

Signal name	Sign	Function number	Available mode		
Slave gantry synchronization alignment sensor	GSS	0x2F	P		
Slave gantry synchronization alignment sensor					

Signal name	Sign	Function number	Available mode		
Dynamic braking relay feedback	DBS	0x30	P	S	T
When this digital input is valid, the dynamic braking relay will be closed.					

Signal name	Sign	Function number	Available mode		
Manual and automatic switching of turret	DAT	0x31	P		
When this digital input is valid, the turret is manual mode.					

Signal name	Sign	Function number	Available mode		
Forward jogging of turret	DFJ	0x32	P		
When this digital input is valid, the turret is forward jogging.					

Signal name	Sign	Function number	Available mode		
Reverse jogging of turret	DRJ	0x33	P		
When this digital input is valid, the turret is reverse jogging.					

Signal name	Sign	Function number	Available mode		
Switching between fully-closed loop and semi-closed loop	FCS	0x34	P		
This function is valid only when P0.38 [enable fully-closed loop] is set to 2 [enable].					
When this digital quantity is valid, it is semi-closed loop; if invalid, it is fully-closed loop					

Signal name	Sign	Function number	Available mode		
PTP terminal pause	PSTOP	0x35	P		
When this digital input is valid, jog control operation pauses.					

Signal name	Sign	Function number	Available mode		
EzJOG terminal pause	ESTOP	0x36	P		
When this digital input is valid, EzJOG operation pauses.					

**4.4.4.2 Digital output instruction:**

Signal name	Sign	Function number	Available mode		
Servo ready output	RDY	0x01	P	S	T

This function is the state signal of the drive. When valid, the drive can be enabled and provide power to the motor and when invalid, the drive gives no response to the command.

Signal name	Sign	Function number	Available mode		
Servo operation output	RUN	0x02	P	S	T

This function is the state signal of the enabled drive.

When valid, the motor is power on.

Signal name	Sign	Function number	Available mode		
Fault output	ALM	0x03	P	S	T

The function is the state signal when the drive displays the fault alarm.

When it is valid, the drive has fault.

Signal name	Sign	Function number	Available mode		
Electromagnetic brake release signal	BRK	0x05	P	S	T

The function is the control release signal of output motor brake.

When it is valid, the control brake is released and then it receives the motor control command; when invalid, the control brake will be disconnected.

Signal name	Sign	Function number	Available mode		
Position command or not	PCMD	0x06	P		

The function is the state signal of whether there is position command or not.

When it is valid, the motor is controlled by the non-zero position command.

Signal name	Sign	Function number	Available mode		
Positioning finished	PLR	0x07	P		

The function is the state signal of positioning finished.

When it is valid, the positioning is finished.

Signal name	Sign	Function number	Available mode		
Control mode switching	MCHS	0x08	P	S	T

This function is the state signal during control mode switching in output compound control mode.

When it is valid, control mode 1 is switched to mode 2; if the function output is invalid, the control mode 2 is switched back to mode 1.

Signal name	Sign	Function number	Available mode		
Speed matching	COIN	0x09	P	S	T

The function is the state signal of speed matching.

When it is valid, the deviation between current speed feedback and speed command is in the range of P3.53.

Signal name	Sign	Function number	Available mode		
Speed reaching	SR	0x0A	P	S	T
The function is the state signal of output speed reaching. When it is valid, the current speed feedback is in the setting value of P3.54.					

Signal name	Sign	Function number	Available mode		
Speed limiting	SL	0x0B			T
The function is the state signal of speed limiting. When it is valid, in the torque mode, if the current torque does not reach the torque command, the speed feedback is in the speed limiting.					

Signal name	Sign	Function number	Available mode		
Speed command or not	SCMD	0x0C	P	S	T
The function is the state signal of whether there is speed command or not. When it is valid, non-zero speed command controls the motors.					

Signal name	Sign	Function number	Available mode		
Speed zero output	ZSO	0x0D	P	S	T
The function is the state signal of whether the current speed feedback is 0.					

Signal name	Sign	Function number	Available mode		
Torque limiting	LM	0x0E	P	S	T
The function is the state signal of torque limiting. When it is valid, it means current torque output has reached the max. torque limit setting.					

Signal name	Sign	Function number	Available mode		
Zeroing finished	HEND	0x0F	P		
The function is the state signal of zero finished. When it is valid, the drive has finished returning to zero and found zero position successfully.					

Signal name	Sign	Function number	Available mode		
Torque reaching	TRCH	0x10			T
The function is the state signal of output torque reaching. When it is valid, the deviation between current torque output and torque command will be in the setting range of P3.59; there is 5% detection retention.					

Signal name	Sign	Function number	Available mode		
PTP arrival	PTPF	0x16	P		
This function is output PTP arrival signal.					

Signal name	Sign	Function number	Available mode		
PTP output 1	PTPO1	0x17	P		
This function is output PTP output 1 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 2	PTPO2	0x18	P		
This function is output PTP output 2 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 3	PTPO3	0x19	P		
This function is output PTP output 3 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 4	PTPO4	0x1A	P		
This function is output PTP output 4 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 5	PTPO5	0x1B	P		
This function is output PTP output 5 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 6	PTPO6	0x1C	P		
This function is output PTP output 6 signal.					

Signal name	Sign	Function number	Available mode		
PTP output 7	PTPO7	0x1D	P		
This function is output PTP output 7 signal.					

Signal name	Sign	Function number	Available mode		
Gantry synchronization output clear	GSC	0x1E	P		
This function is to output the clearance signal of gantry synchronization					

Signal name	Sign	Function number	Available mode		
Dynamic brake relay control	DBRC	0x1F	P	S	T
This function is output dynamic brake relay control signal.					

#### 4.4.5 Pulse input signals and functions

Sign	Pin no.	Name	Function
OCP	38	Position command pulse input 1	<ul style="list-style-type: none"> <li>In the position control mode, act as the position command input terminal.</li> <li>In other control mode, the terminal is invalid.</li> <li>Allowed Max. input pulse frequency: 4MHz in differential motion mode, 200kHz in open-collector mode.</li> </ul>
PULS+	23		
PULS-	24		
OCS	31	Position command pulse input 2	
SIGN+	32		
SIGN-	33		

## 4.4.6 Analog input signals and functions

Sign	Pin no.	Name	Default value	Function name	Function
AD1	1	Analog input 1	0x00	Invalid	<ul style="list-style-type: none"> <li>● Precision of AD1 is 16-bit and precision of AD2 and AD3 is 12-bit.</li> <li>● If standard model (there is "-S" in the drive nameplate) is used as the speed control, AD1 channel is invalid, please take AD3 as the speed command input terminal and modify P3.70 to "speed command".</li> <li>● External analog input terminals. The input impedance is 10kΩ. The input voltage range is -10V~+10V. A voltage exceeding ±11V may damage the drive.</li> <li>● The range and offset setting and function definition can be set.</li> </ul>
AD2	20	Analog input 2	0x03	Speed command	
AD3	7	Analog input 3	0x04	Torque command	
GND	5, 6, 8, 19, 35	Signal ground	-	-	

## 4.4.7 Encoder output signals and functions

Sign	Pin no.	Name	Function
OA+	44	A phase output	<ul style="list-style-type: none"> <li>● Output the frequency divided encoder signal, comply with the standard of TIA/EIA-422-B.</li> <li>● The output phase A pulse and phase B pulse is still quadrature. When it rotates forward, phase B leads phase A by 90°. When it rotates in reverse, phase A leads phase B by 90°.</li> <li>● Frequency division and frequency multiplication with any integer and decimal fraction is allowable.</li> <li>● The output signals have no isolation.</li> </ul>
OA-	43		
OB+	41	B phase output	
OB-	42		
OZ+	28	Z phase output	
OZ-	27		
OCA	36	A phase output	● Output the open-collector signal of phase A, without isolation
OCB	30	B phase output	● Output the open-collector signal of phase B, without isolation
OCZ	26	Z phase output	● Output the open-collector signal of phase Z, without isolation

## 4.4.8 Analog output signals and functions

Sign	Pin no.	Name	Function
AO1	21	Analog output 1	Its output function definition can be set, and the range and offset settings can be set.
AO2	25	Analog output 2	Its output function definition can be set, and the range and offset settings can be set.

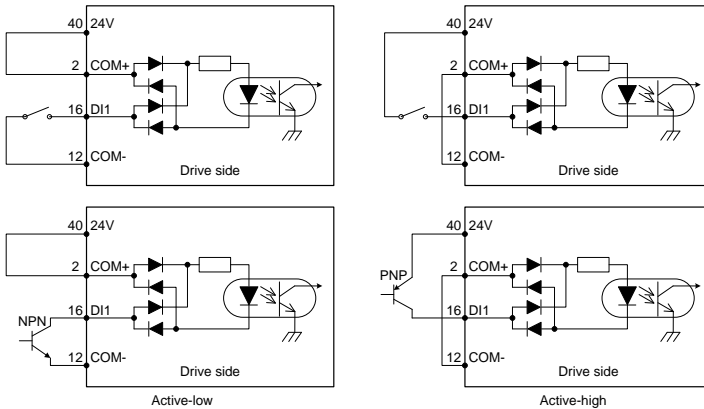

## 4.5 CN1 wiring instruction

### 4.5.1 Wiring of digital input circuit

Connection diagram when the power supply is provided by user:

Connection diagram when the local power supply is used:

- As shown in above figure, digital input circuit supports mechanical switch connection mode and open collector connection mode of triode (NPN type and PNP type, mixed-use of these two types is not allowed);
- Users can use either the 24V power supply carried by the servo drive (it only can provide 100mA current) or 12V–24V power supply provided by the user.

### 4.5.2 Wiring of the pulse input circuit

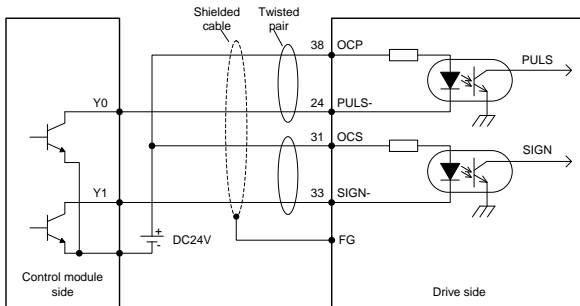

#### Connect mode 1: Differential mode

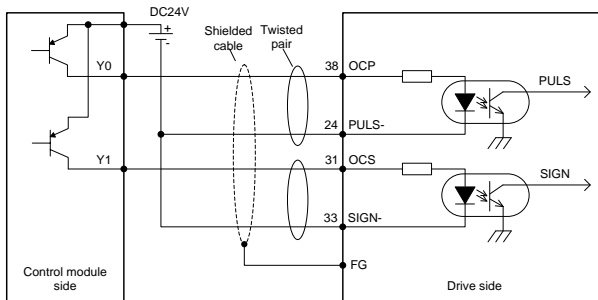

- The maximum frequency of input pulse is 4MHz and the input signal voltage is  $\pm 5V$ ;
- With the best anti-noise capability, this signal transmit method is recommended as the preferred.

#### Connection mode 2: Open collector mode 1

The control module is NPN (common cathode)

The control module is PNP module (common anode):

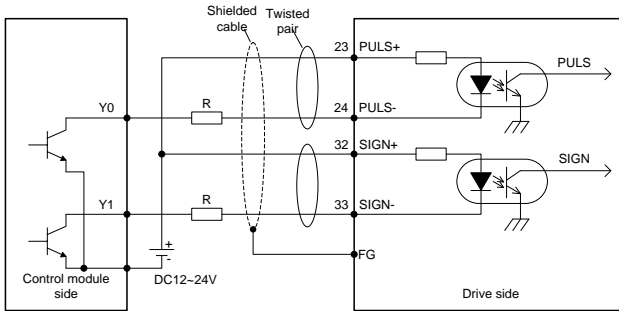

- The max. input pulse frequency is 200kHz; if the local 24V power supply (it only can provide 100mA current) or the 24V power supply provided by the user is used, there is no need to connect to current limit resistor. Generally, most of Japanese PLC is NPN module, while most of

European PLC is PNP module.

**Connection mode 3: Open collector mode 2**

The control module is NPN (common cathode):

The control module is PNP (common anode):

- The input pulse frequency is 200kHz; if the local 24V power supply (it only can provide 100mA current) or the 12–24V power supply provided by the user is used, it is required to connect to current-limiting resistor R (the resistance is selected as the below table).

$V_{DC}$	R parameter
12V	1k $\Omega$ , 1/4W
24V	2k $\Omega$ , 1/3W

$$\frac{V_{DC}-1.5}{R+68} \approx 10(\text{mA})$$

For all the 3 methods, shielded twisted-pair must be used and the length should be less than 3m.

### 4.5.3 Wiring of the analog input circuit

- There are three analog input circuits, AD1, AD2 and AD3, precision of AD1 is 16-bit (optional for standard models), precision of AD2 and AD3 is 12-bit (standard). The input impedance is 10kΩ. The input voltage range is -10V~+10V. If the voltage is higher than ±11V, the circuits may be damaged.
- If the non-standard model is used as the speed control, AD1 channel is invalid, please take AD3 as the speed command input terminal and modify P3.70 to “speed command”.

### 4.5.4 Wiring of digital output circuit

Connection diagram when the power supply is provided by user:

Connection method when the local power supply is used:

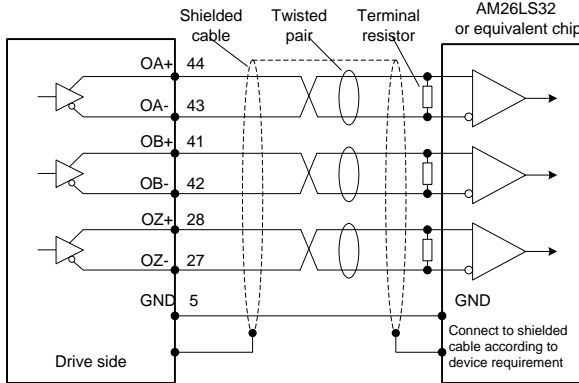

- There are 6 digital output circuits in total and all of them adopt the open-collector output as shown in the figure. They can be used to drive the relay coil or optical coupled load. The loading capacity is shown in the figure.

- When inductive loads such as relay coil are connected, a free wheel diode must be fitted as shown in the figure; when optical coupler is connected, current limit resistor must be connected, otherwise the drive will be damaged.
- The local 24V power supply only can provide 100mA current. If the actual load current is larger than 100mA, the user should provide the power supply by themselves. The recommended capacity is greater than 500mA.

**4.5.5 Wiring of frequency division output circuit of encoder feedback signal**

Differential mode:

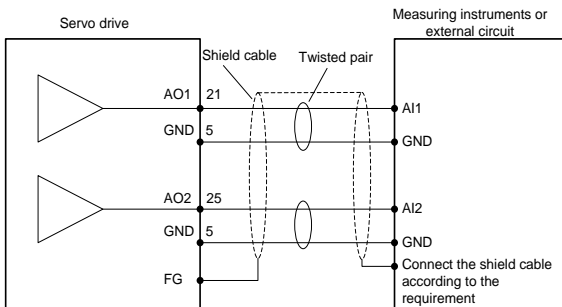

Open-collector mode:

- Phase A, B and Z all provide differential output and open-collector output signals.
- For differential output signal, it is recommended to use AM26C32 or equivalent differential receiving chip and be sure to fit a terminal matching resistor of about 220Ω.
- For the phase A, B, Z signal of open-collector output, as the signal pulse width is very narrow, the user shall use high speed optical coupler to receive this signal.
- Both output circuits have no isolation.

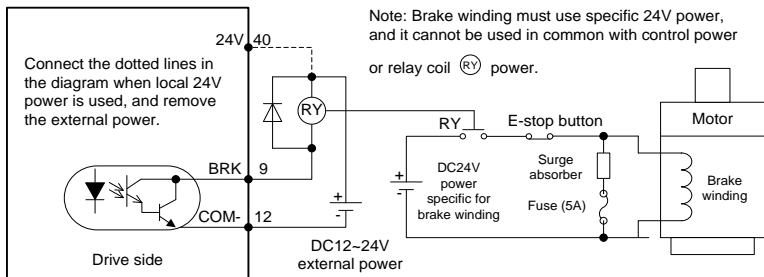

### 4.5.6 Wiring of the analog output circuit

- There are two analog output circuits in all. The output voltage range is -10V~10V. The Max output current is 3mA.

### 4.5.7 Wiring of the electromagnetic brake

If the servo drive is used in the vertical shaft applications, the electromagnetic brake can be used to stop and keep the dropping speed when servo drive is power off. The wiring diagram is:

- 24V power supply specific for the electromagnetic brake cannot be used with the power supply for control signal;
- (RY) is the relay coil, please pay attention to the direction of the diode;
- The electromagnetic brake is used to keep the speed, other than stop;
- Please install the external braking devices besides the electromagnetic brake.

## 4.6 CN5 wiring diagram

### 4.6.1 CN5 wiring diagram of small power range (100W–5.5kW)

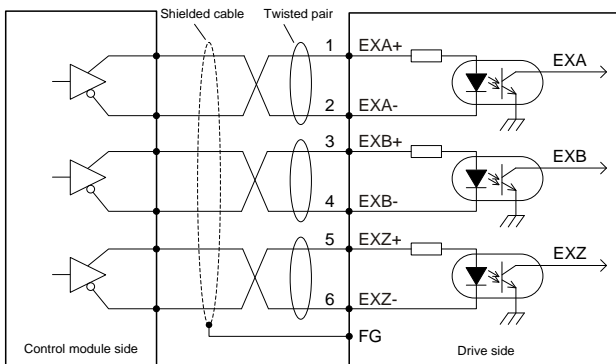

### 4.6.2 CN5 wiring diagram of medium power range (7.5kW–55kW)

### 4.6.3 2<sup>nd</sup> encoder input circuit wiring of medium power range (7.5kW–55kW)

#### Connection mode 1: Differential mode

- Differential pulse input signal voltage is  $\pm 5V$ , max frequency is 4MHz;
- Such signal transmission mode has optimal anti-noise capacity, it is recommended to take this connection mode as priority.

#### Connection mode 2: Open collector mode 1

Control module is NPN type (common cathode):

Control module is PNP type (common anode):

- Max input pulse frequency is 200kHz; if the local 24V power of DA200 (only 100mA power is available) or the 24V power provided by the user is used, there is no need to connect current limit resistor. Generally, PLC of Japanese brands mainly adopts NPN type while PLC under European brands mainly adopts PNP type.

**Connection mode 3: Open collector mode 2**

Control module is NPN type (common cathode):

Control mode is PNP type (common cathode):

- Max input pulse frequency is 200kHz; if the local 24V power of DA200 (only 100mA power is available) or the 24V power provided by the user is used, it is required to connect to current limit resistor R.

V <sub>DC</sub>	R parameter	$\frac{V_{DC}-1.5}{R+68} \approx 10(\text{mA})$
12V	1kΩ, 1/4W	
24V	2kΩ, 1/3W	

These three connection modes all require shielded twisted pair whose length should be less than 3m.

# 5 Running and operation

## 5.1 Running

### 5.1.1 First powering on

Please check following items before power on:

#### 1) Wiring

- ◆ The power supply of the servo drive (L1, L2, L3, L1C, L2C or R, S and T) should be connect to proper techniques; see chapter 3.2 for details;
- ◆ The output phase of the servo drive (U, V and W) should be the same as that of the cables of the servo motor;
- ◆ There is no short circuit between the output of the servo drive (U, V and W) and the input power supply (L1, L2, L3, R, S and T);
- ◆ All wiring comply with the standard wiring shown in chapter 4;
- ◆ Ensure the external terminal (SON) for servo enabling is set to OFF;
- ◆ Ensure the servo drive and the servo motor are grounded to properly;
- ◆ When using external braking resistor, for products with small power range, the short connection cable between B2-B3 must be removed;
- ◆ Do not put voltage above DC24V on CN1;
- ◆ The cable stress is within the designated range.

#### 2) Environment

- ◆ There are no foreign objections, such as metal and other wire lead which can cause short connection of signal and power wires.

#### 3) Mechanical parts

- ◆ The installation of the servo motor and the connection of shafts and mechanics are reliable;
- ◆ The servo motor and the machines are available to run;
- ◆ Do not run the motor at negative load (the direction of the output torque of the motor is contrary to the motor speed direction).

If all above items are checked OK, switch on the power supply:

#### 5.1.1.1 Sequence of powering ON/OFF

The control circuit and the main circuit of the drive are supplied separately. In principle, when powering on, switch on the power supply of the control circuit (terminals L1C, L2C) first and then switch on the power supply of the main circuit (terminals L1, L2, L3). When powering off, switch off the power supply of the main circuit first and then switch off the power supply of the control circuit.

After switching on the control circuit power supply and before switching on the main circuit power supply, R0.30 will display "0" and after power on of the main circuit, R0.30 will display "2" and the servo drive can be enabled.

For product with medium power range (7.5kW–55kW), please connect to main circuit 3PH power (R, S and T terminals).

### 5.1.1.2 Checking after powering-on

After switching on both of the control circuit and main circuit power supplies, if the power supply is OK, the LED indicator will display 0 first and then display 8. If there is no fault alarm of the servo drive, the LED on the front panel displays the current speed of the servo motor as default. The default parameter can be set through parameter P0.15. If there is a fault of the servo drive, the LED displays current alarm sign and flickers. Please fix the fault by referring to chapter 9.

### 5.1.1.3 Set the motor code

Before enabling operation, please set P0.00 according to the motor code on motor nameplate, otherwise, the motor may operate abnormally or reversely and cause safety issues.

### 5.1.2 Trial jogging

Trial jogging can check whether the servo drive and the servo motor are intact and conduct preliminary debugging of the system including the servo drive, servo motor and peripheral equipment. Run the servo motor by JOG operation after ensuring that the wiring is correct and there is no fault alarm and no abnormal running, See chapter 5.2.5 for detailed instructions. Before jog running, ensure:

- ◆ The motor isn't in running state. If the motor is running, JOG operation is invalid;
- ◆ The load inertia shouldn't exceed 15 times of the motor inertia. Otherwise it may cause serious mechanical vibration;
- ◆ The jog speed can be set via parameter P0.05.
- ◆ The accelerating/decelerating time during jogging can be set via parameters P0.54, P0.55 and P0.56, P0.57.

### 5.1.3 Running at the position control mode

Simple connection:

Parameter	Function	Setting value
P0.03 <sup>1</sup>	Control mode selection	0
P0.22 <sup>1</sup>	Pulse number per motor resolution	Set according to the requirement
P0.23 <sup>1</sup>	Pulse input	Set according to the requirement
P0.24 <sup>1</sup>	Reverse of pulse input direction	0

Steps:

1. Complete the connection between the drive and the servo motor.
2. Set P0.03 to "0", the position control mode.
3. Confirm the pulse output of the upper controller and adjust P0.23. Keep the pulse type the same with that of the upper controller. Please refer to the instruction of P0.23.
4. Disconnect the control power supply after the modification of P0.03, P0.23 and then power on again.
5. Connect CN1 to the drive and apply the power supply. Control the connection between SON and COM-. And then, the servo enters into the locking state.
6. Send the low frequency pulse command from the upper controller and rotate the motor at low speed.
7. Ensure the rotating direction of the motor is as the designated. The direction can be modified through the upper controller or operate on P0.24.
8. Ensure the pulse number is as the designated. Please refer to the instruction of P0.22, P0.25 and P0.26.

**5.1.4 Running at the speed control mode**

Simple connection

Parameter	Function	Setting value
P0.03 <sup>1</sup>	Control mode selection	1
P0.40	Speed command selection	1
P3.26	Function of analog input 1	3
P0.42	Analog input 1 gain	500
P3.20	Analog speed command offset	Set according to the requirement

Steps:

1. Complete the connection between the drive and the servo motor.
2. Set P0.03 to "1", the speed control mode.
3. It is necessary to disconnect the control power supply after saving the modified value of P0.03. And it will be valid after repowering on.
4. Set P0.40 to "1", external analog speed command mode.
5. Set P3.26 to "3", analog input 1 is speed command;
6. Set P0.42 to the required value. Please refer to the instruction of P0.42.
7. Connect the corresponding terminals of CN1.
8. Connect the CN1 to the drive and power on. Control the connection between SON and

COM-. Then the servo enters into the locking state.

- The motor shaft may rotate at a low speed if there is no upper command voltage. It is necessary to adjust P3.20. Please refer to the detailed instruction of P3.20.

### 5.1.5 Running at the torque control mode

Simple connection:

Parameter	Function	Setting value
P0.03 <sup>1</sup>	Mode selection	2
P0.60	Torque command selection	1
P3.27	Function of analog input 2	4
P0.61	Torque command direction selection	Set according to requirement
P0.62	Analog input 2 gain	10
P3.23	Analog input 2 offset	Set according to requirement
P0.46	Speed limit 1	100

Steps:

- Complete the connection between the drive and the servo motor.
- Set P0.03 to "2", the torque control mode.
- It is necessary to disconnect the control power supply after saving the modified value of P0.03. And it will be valid after repowering on.
- Set P0.60 to "1", external analog torque command mode.
- Set P0.61 to the required value. Please refer to the instruction of P0.61.
- Set P3.26 to "4", analog input 1 is torque command;
- Set P0.62 to the required value. Please refer to the instruction of P0.62.
- Connect the corresponding terminals of CN1.
- Connect the CN1 to the drive and power on. Control the connection between SON and COM-. Then the servo enters into the locking state.
- The motor shaft may rotate at a low speed if there is no upper command voltage. It is necessary to adjust P3.23. Please refer to the detailed instruction of P3.23.
- In the torque mode, please adjust the speed limit and set P0.46 to the required value. Please refer to the detailed instruction of P0.46.

### 5.1.6 Parameter setting before running the servo

Parameter setting must be conducted before running the servo. Relevant parameters can be set via the panel, PC software or communication to meet the function and performance requirements of the site application. See chapter 6 for the detailed description of all parameters of the servo drive. Some

of these parameters need to be set according to the site application demand. For examples, pulse input mode, electronic gear, frequency division coefficient of encoder output, upper/lower limit of analog input, etc. Some of these parameters need to be set according to the site debugging. For example, the parameters of the regulator loop which affect the system performance and other similar parameters. For most parameters the factory default values are appropriate.

Hereunder only some necessary parameters are listed:

#### 1) Mode setting

The control mode (position mode, speed mode, torque mode or other compound control mode) can be set through setting parameter P0.03 according to the control requirements on the site. The mode will be valid after repowering on.

#### 2) Command input

Set or enter relevant commands to control the position, speed or torque of the servo motor's shaft according to the setting of parameter P0.03.

- ◆ In the position mode: pulse command (3 kinds of input mode), internal torque limit command or external analog torque limit command;
- ◆ In the speed mode: internal speed command or external analog speed command, internal torque limit command or external analog torque limit command;
- ◆ In the torque mode: internal torque command or external analog torque command, internal speed limit command or external analog speed limit command.

### 5.1.7 Servo enabling

Enable the servo via the external servo enabling terminal (SON) or internal servo enabling parameter (P0.04). See the function description of terminal SON and detailed explanation of parameter P0.04.

When servo enabling:

- ◆ If no alarm occurs, the panel will display the default monitoring parameters;
- ◆ The fan starts to run;
- ◆ In position mode, if there is no pulse command input, the servo is in locked state;
- ◆ In the speed mode, the servo motor runs at the given speed;
- ◆ In the torque mode, if no torque is applied externally, the servo motor accelerates from zero speed to the limit speed. If the external torque is larger than the internal setting one, the servo motor maintains the state of zero speed output;
- ◆ If a servo alarm occurs, the panel will display ErXX-X and flicker and the servo motor will get into the inertia running state.

### 5.1.8 Servo stop/Stop running

If the servo drive is in the following conditions, the servo motor will coast to stop or stop normally. Coasting to stop means the drive cuts off output immediately, the motor coasts to stop under the action of inertia, and does not keep in locked state. Stopping means the drive outputs reverse torque to make the motor to decelerate to zero speed and, after that, the motor is in a locked state.

- ◆ When the servo enabling terminal (SON) signal is set to OFF, the servo motor will stop. Select

the stopping method through setting parameter P4.30. See description of P4.30 for details. This process will not cause regenerative braking.

- ◆ When a fault alarm occurs, the servo motor will stop. Select the stopping method of the servo motor when an alarm occurs through setting parameter P4.30. See description of P4.30 for details. This process will not cause regenerative braking.
- ◆ When the digital input terminal configured as zero speed clamp (ZRS) is set to ON and P0.58 is at non-zero value, the servo motor stops running. When P0.58 is set to 1–3, the motor stops running based on the DEC time set by P0.55 and P0.57 in speed mode, and servo is in locked state after stop; in torque mode, the servo motor stops running immediately. Such stopping process may cause regenerative braking. If braking overload fault alarm occurred, please connect to proper external braking resistor.
- ◆ If the travel limit switch block function is invalid (parameter P3.40=0), and digital input terminal signal configured as travel limit (POT/NOT) is set to ON, P0.55 and P0.57 of the servo motor will immediately decelerate to stop based on the set value of P0.55 and P0.57. it will be in locked state after stop. If reverse running command input is generated after motor stops, the motor can run in reverse direction.
- ◆ If the emergency stop switch block function is invalid (parameter P3.41=0), and the digital input terminal configured as EMG is set to ON, the servo motor will coast to stop.
- ◆ If the duration of servo disable signal is too short (less than 500ms), PWM signal may be in off state once servo is enabled again.

### 5.1.9 Sequence diagram

#### 5.1.9.1 Sequence diagram of power-on and servo ON

Note 1: The delay time from the completion of microprocessor initialization to the readiness of servo output can be set via P4.54;

Note 2: The condition for the RDY output signal electric level to become low is: servo has no fault and main circuit DC voltage has been established (voltage is higher than 250V/430V (220V series/400V series)); when the main circuit DC voltage is less than 170V/310V (220V series/400V series), Er13-1 alarm will occur. The time interval from the readiness of servo and enabling of servo can be controlled by users;

Note 3: The servo enable signal can become valid only when RDY output signal is valid;

Note 4: The actual electric level corresponding to the IO valid state can be set via P3.00~P3.15.

**5.1.9.2 Sequence diagram of power loss during running**

Note 1: If the voltage of the control circuit is less than 170V/330V(220V series/400V series), the undervoltage fault will occur and the output level of the servo fault (ALM) will increase;  
 Note 2: If the drive temperature is less than 45 °C, the fan stops, if the drive temperature is higher than 45 °C, the fan will stop after the micro processor stops;  
 Note 3: The output delay of electromagnetic brake release signal is set by P3.57; if the speed slows down to the setting value of P3.58 (30r/min by default) during the time set by P3.57, BRK signal will become invalid;  
 Note 4: The actual level corresponding to input/output valid state can be set by P3.00-P3.15

**5.1.9.3 Servo OFF sequence in a locked state**

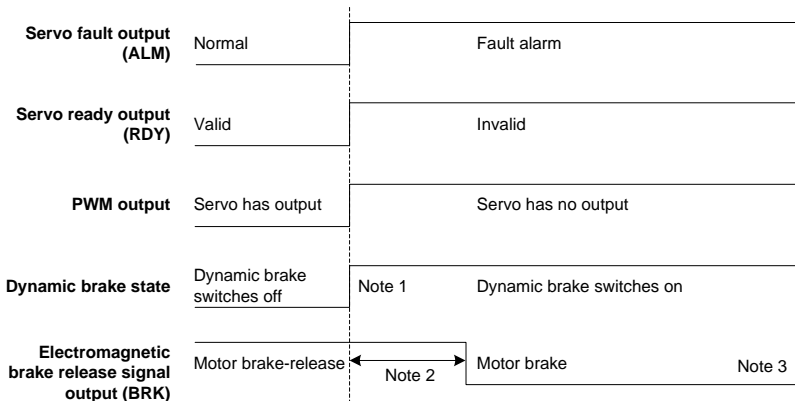

Note 1: The startup of dynamic brake can be set by P4.30;  
 Note 2: The servo locking time after braking can be set by P3.56;  
 Note 3: The actual electric level corresponding to I/O valid state can be set by P3.00-P3.15.

5.1.9.4 Servo OFF sequence in running state

Note 1: The switch on/off of the dynamic brake can be controlled by P4.30;  
 Note 2: The output delay of electromagnetic brake release signal is set by P3.57; if the speed is less than the setting value of P3.58 during the time of P3.57, the BRK signal will become invalid;  
 Note 3: The actual electric level corresponding to input/output valid state can be set by P3.00~P3.15.

5.1.9.5 Sequence of fault alarm

Note 1: The switch on/off of the dynamic brake can be controlled by P4.30;  
 Note 2: The output delay of electromagnetic brake release signal is set by P3.57; if the speed is less than the setting value of P3.58 during the time of P3.57, the BRK signal will become invalid;  
 Note 3: The actual electric level corresponding to input/output valid state can be set by P3.00~P3.15.

## 5.2 Display and operation

### 5.2.1 Display

Keypad diagram:

LED display character (reference table):

LED display character	Corresponding symbol	LED display character	Corresponding symbol	LED display character	Corresponding symbol	LED display character	Corresponding symbol
	0		1		2		3
	4		5		6		7
	8		9		.		-
	a		b		c		d
	e		f		g		h
	i		j		k		l
	m		n		o		p
	q		r		s		t
	u		v		w		x
	y		z				

Button function table:

Key	Function
<b>MODE</b>	Used to switch between different modes or return to previous menu
<b>UP</b>	Used to select parameter upwards or increase value
<b>DOWN</b>	Used to select parameter downwards or decrease value
<b>SET/ SHIFT</b>	<p><b>Press for a long time =SET</b> (about 0.6 seconds) Used to select parameter downwards or decrease value</p> <p><b>Press for a short time =SHIFT:</b> When setting a parameter, it is used to select the position of the current digit</p>

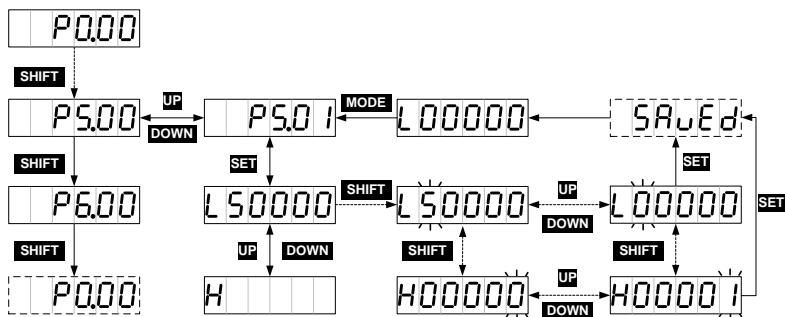

Operation flowchart:

If the drive is power on, the screen will display `000000` for about 1 second, and then display `888888` for about 1 second, after that, enter into the “General monitoring mode”.

1. Press **MODE** key to switch “General monitoring mode”→“Parameters mode”→“PTP mode”→“ Auxiliary function mode”→“Fault mode”→“STO mode” as a cycle mode. If no fault or no STO input, the fault mode and STO mode can be ignored.
2. If new fault occurs, it will switch to “Fault mode” by pressing **MODE** key. If no key is pressed in 20 seconds, it will switch to “Fault mode” automatically.
3. In “General monitoring mode”, **UP/DOWN** key can be used to switch monitoring parameters. The name of parameters will display for 2.5 seconds, and then the current value will be displayed.
4. In parameters mode, **SHIFT** key can be used to switch the group number and **UP/DOWN** key can be used to select the internal parameters number.
5. In the parameters setting mode, pressing **SHIFT** to make the flickering words move left and use the **UP/DOWN** key to modify the setting value of the high bit.
6. After parameters setting, pressing **SET** key to save the parameters or execute the commands.
7. After parameters setting, the screen will display `SAVE` (for storage parameter and when P0.17 is set to 0 [individual storage]) or `SUCCESS` (for non-storage parameter or P0.17 is set to 1 [batch storage]), and then return to the parameters mode automatically.

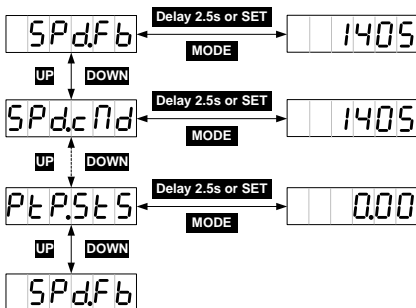

8. Setting of long parameters (corresponds to parameters with over 6 digits) in parameter area:

5.2.2 State monitoring mode

After power on, the screen will enter into “General monitoring mode”, display the parameters name for about 2.5 seconds and then display the current value. After pressing **MODE** key, **UP/DOWN** key can be used to switch monitoring parameters. See chapter 10.3 *Common monitoring parameter table* for details. The monitoring parameters displayed by default can be set via P0.15. If no operation is carried out under interfaces other than parameter value display interface, it will return to the monitoring parameter interface in 20 seconds.

Operation flowchart:

5.2.3 Monitoring mode

**MODE** key can be used to switch into the monitoring mode. **SHIFT** key can be used to select the group number of the monitoring parameters, **UP/DOWN** can be used to select the internal parameter number and pressing for a long time, it can be used to select the parameter number quickly. After finding the target, **SET** key can be used to view the current value and **MODE** can be used to return the displaying interface. If no operation in R3 menu interface, it will return to the monitoring interface in 20 seconds. If no operation in R0 and R1 menu interface, it will stay on the displaying interface.

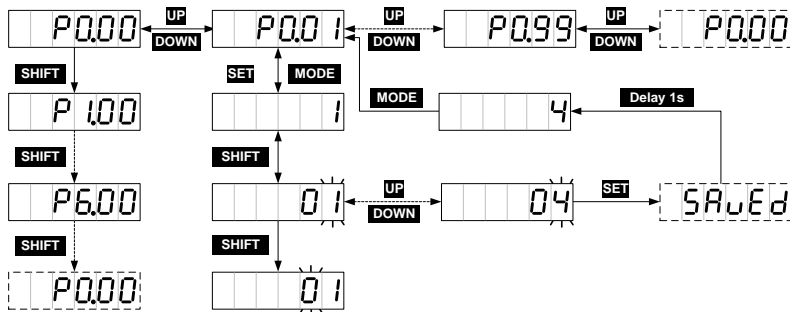

Operation flowchart:

### 5.2.4 Parameter setting

**MODE** key can be used to switch into the parameters setting mode. **SHIFT** key can be used to select the group number of the monitoring parameters, **UP/DOWN** can be used to select the internal parameter number and pressing for a long time, it can be used to select the parameter number quickly. After finding the target, **SET** key can be used to view the current value and **SHIFT** key to the parameters setting. In the setting interface, **UP/DOWN** key can be used to set the value, **SHIFT** key can be used to select the setting bit. After setting, press **SET** key to save the parameters. After finishing, the screen will display **SAvEd** (for storage parameters and P0.17 is set to 0) or **SUccES** (for non-storage parameter or P0.17 is set to 1), and then return to the parameters mode automatically.

Operation flowchart:

### 5.2.5 Auxiliary function instruction

#### 5.2.5.1 Auxiliary function menu

Press **MODE** to the auxiliary mode and press **UP/DOWN** to select auxiliary functions, the auxiliary function table is shown below:

Sign	Name
EF-JoG	Jogging test
EF-dRF	Restore the factory parameter
EF-PJo	Program commissioning
EF-AR1	Analog input 1 zero drift clear
EF-AR2	Analog input 2 zero drift clear
EF-AR3	Analog input 3 zero drift clear
EF-JId	Inertia identification
EF-Enc	Absolute value encoder clear

Note: The auxiliary functions can be operated only when servo is disabled, otherwise users cannot enter the auxiliary function menu.

### 5.2.5.2 Operation flowchart of trial jogging

Press **MODE** key to switch to the auxiliary function mode. Press **UP/DOWN** key to the EF-JoG menu, and press **SET** key to the jogging interface. The interface will display the current speed of the motor. Press **UP** key, the motor will rotate to the setting speed anticlockwise and stops when releasing the key. Press **DOWN** key, the motor will rotate to the setting speed clockwise and stops when releasing the key.

### 5.2.5.3 Operation flowchart of restoring the factory parameter

Press **MODE** key to switch to the auxiliary function mode. Press **UP/DOWN** key to the EF-dRF menu, and press **SET** key to the interface. The interface will display rERdy. Press **SET** key to restore to the factory values, it will display StARt, after finishing, it will display FInIsh. The operation flowcharts for restoring default values and clearing analog input 1 zero drift, analog input 2 zero drift and analog input 3 zero drift are the same.

### 5.2.5.4 Operation flowchart of program commissioning

Press **MODE** key to the auxiliary function mode. Press **UP/DOWN** key to the **EF-PJo** menu, and press **SET** key to the interface. The interface will display **rERdY**. In the interface of **rERdY**, **SHIFT** key can be used to switch between **rERdY** and **on**, start and stop the commissioning function. In the interface of **on**, **UP/DOWN** key can be used to start the program commissioning and has no relationship with P5.00. If the motor direction is counterclockwise, it can be started by **UP** key. If the motor direction is clockwise, it can be started by **DOWN** key. After starting, the interface will display the current speed.

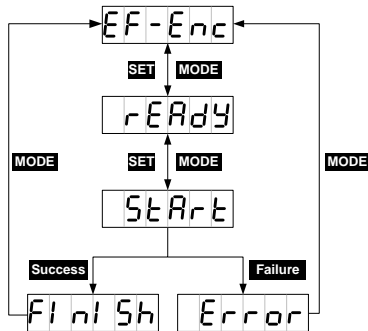

### 5.2.5.5 Operation flowchart of inertia identification

Press **MODE** key to the auxiliary function mode. Press **UP/DOWN** key to the **EF-JId** menu, and press **SET** key to the interface. The interface will display **rERdY**. Press **SET** key to start the inertia identification. After finishing, the result **23** will be displayed for about 3 seconds and saved automatically. It will return to eh parameters after displaying **SAvEd** for about 2 seconds.

### 5.2.5.6 Operation flowchart of absolute encoder clear

If the multi-turn encoders are used, the zeroing of mechanical system is needed after first power on. Press **MODE** key to switch to the auxiliary function mode. Press **UP/DOWN** key to the **EF-Enc** menu, and press **SET** key to the interface. The interface will display **rEAdy**. Press **SET** key to start the clearing, the interface will display **StArT**, and after finishing, it will display **FinIsh**; if the encoder model is not matched or the operation is failed, it will display **ErRor**.

### 5.2.6 Alarm display

When the servo drive runs abnormally, it will perform fault alarm and stop automatically. At this time the panel will display the fault alarm warning sign. The format is ErXX-X, of which, XX is the master code and X is the sub code.

Please refer to appendix 10.4 for the meanings of the alarm or warning identifiers.

### 5.2.7 Alarm clearing

For those faults that can be cleared online, if the fault condition is removed, fault alarm display can be cleared by short connecting the digital input terminal configured as fault clearing function (P3.00–P3.09 configured as 0x004 or 0x104) with COM-. If the servo still has enabling command input, the drive will not be able to clear the fault automatically.

For the fault alarms which cannot be cleared online, it can be cleared after repower on.

## 6 Function codes

P-position mode; S-speed mode; T-torque mode.

The definition of direction: From the angle of facing motor shaft, the counterclockwise direction is forward (CCW for short); clockwise (CW) is reverse; in terms of speed and torque reference value, positive value means position direction and negative value means negative direction.

The function codes with the superscript of “1” indicate that these parameters can be valid only when the system is reset and restarted or repowered after disconnection.

The function codes with the superscript of “2” indicate that these parameters are valid when the servo drive stops. The modification during operation is invalid.

The function codes with the superscript of “\*” indicate that these parameters are not saved after power off.

Modbus communication address is decimal, the address of PROFIBUS-DP is the same with Modbus; CANopen communication address is hex and the length of 16-bit is the primary code and the length of 8-bit is the sub-code.

### 6.1 Basic control (P0 group parameters)

#### 6.1.1 Basic setting

P0.00 <sup>1</sup>	Motor model	Setting range	Default	Unit	Available mode		
		0-9999999	0	-	P	S	T

This parameter is set to 0 by default. Users must set according to motor nameplate.  
 If the motor model is 0, and the motor is standard communication-type encoder motor, the drive will read the motor parameters automatically.  
 For example, the nameplate of 400W motor is shown below.

Of which, No.: 3010004 is the set value of the parameter.

**Note:** Improper parameter value will result in abnormal operation of servo system, or even lead to serious drive or motor faults. Double check whether this parameter matches with the motor before the initial power up.

P0.00 <sup>1</sup>	Data size	32bit	Data format	DEC
	Modbus address	1000, 1001	CANopen address	0x2000, 0x00

P0.01 <sup>1</sup>	Encoder type	Setting range	Default	Unit	Available mode		
		1-12	4 <sup>*1</sup>	-	P	S	T

Generally, the system will set this parameter automatically after P0.00 is set correctly. In cases where encoder disconnection fault is reported during power up when motor is connected correctly, please check whether the drive supports motor encoder type, refer to chapter 1.1.3. The naming of servo motor contains encoder type, refer to chapter 1.2.2.

Relation between encoder type and P0.01 setting value:

Motor nameplate Encoder type <sup>*2</sup>	Setting value	Meaning
1	1	2500-PPR standard incremental
3	3	17-bit single-turn absolute value
4	[4]	17-bit multi-turn absolute value <sup>*3</sup>
7	8	Rotary transformer
9	10	23-bit multi-turn absolute value <sup>*3</sup>
-	Other value	Reserved

<sup>\*1</sup> Different motors correspond to different types of encoders.

<sup>\*2</sup> Refer to chapter 1.2.2 ⑧.

<sup>\*3</sup> When the multi-turn encoders are used, it is necessary to change the battery when the drive is power on to prevent losing absolute position. The standard battery is 2000mAh and the replacement cycle is 1.5-2 years.

P0.01 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1002, 1003	CANopen address	0x2001, 0x00

P0.02 <sup>1</sup>	Forward rotation of motor <sup>*1</sup>	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T

Set the forward rotation of motor:

Setting value	Definition
[0]	Anticlockwise is forward rotation
1	Clockwise is forward rotation

<sup>\*1</sup> Definition of forward rotation of motor. The view angle faces shaft output direction of motor.

P0.02 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1004, 1005	CANopen address	0x2002, 0x00

P0.03 <sup>1</sup>	Control mode selection	Setting range	Default	Unit	Available mode		
		0–9	0	-	P	S	T
This parameter can be used to set the operating mode of the system:							
Setting value	1 <sup>st</sup> working mode	2 <sup>nd</sup> working mode	Instruction				
[0]	P	/	Position mode: Control the angular displacement of servo motor via internal/external position command, thus achieving controlling over mechanical motion displacement.				
1	S	/	Speed mode: Control the rotation speed of the servo motor with the internal or external speed command				
2	T	/	Torque mode: Control the torque of the servo motor with the internal or external torque command.				
3	P	S	Position/speed mode switching: The position mode and speed mode can be switched with the control mode switching terminal.				
			<p><b>Note:</b> For switching from position mode to speed mode, there are two kinds of switching methods which can be selected via P0.92; When switching from speed mode to position mode, the motor will stop at the reference position of P0.91 before switching to position mode.</p>				
4	P	T	Position/torque mode: The position mode and torque mode can be switched with the control mode switching terminal				
			<p><b>Note:</b> For switching from position mode to torque mode, there are two kinds of switching methods which can be selected via P0.92; When switching from torque mode to position mode, the motor will stop at the reference position of P0.91 before switching to position mode.</p>				
5	S	T	Speed/torque mode: The speed mode and torque mode can				

			<p>be switched with control mode switching terminal</p> <p>The diagram shows three horizontal axes: Mode switching signal (MCH), Motor speed, and Torque command. The MCH signal is high during 'Speed mode' and 'Torque mode', and low during the second 'Speed mode'. The Motor speed curve shows a ramp down during the first Speed mode, a dwell during Torque mode, and a ramp up during the second Speed mode. The Torque command curve shows a ramp up during Torque mode.</p> <p><b>Note:</b> The switching mode is not limited by actual operation.</p>
6	/	/	Reserved
7	CANopen	/	CANopen mode (CANopen type servo support)
8	EtherCAT	/	EtherCAT mode (EtherCAT type servo support)
9	MotionNet	/	MotionNet mode (MotionNet type servo support)

Remark: Set P0.03 and P3.00–P3.09 will switch automatically according to the selected control mode.

**Note:**0:OFF (internal optical coupler corresponding to the input is not conducted);

1:ON (internal optical coupler corresponding to the input is conducted).

P0.03 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1006, 1007	CANopen address	0x2003, 0x00

P0.04*	Internal enabling command	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter is used to control the operation state of the servo drive.

The relation between internal enable instruction and external terminal enable instruction is shown below:

Setting value	External terminal command state	Working state of servo drive
0	0 (internal optical coupler which corresponds to the input is not conducted)	Stand-by (OFF)
0	1 (internal optical coupler which corresponds to the input is conducted)	Enabling running (ON)
1	0 (internal optical coupler which corresponds to the input is not conducted)	Enabling running (ON)
1	1 (internal optical coupler which corresponds to the input is conducted)	Enabling running (ON)

**Note:**

1. When P0.04 is 1 and the external terminal command converts from 1 to 0, the servo drive will be disabled, namely P0.04 will change to 0 automatically.

2. When this parameter is operated via the LED panel, it can only be switched between 0 and 1 via **SET** key and **UP/DOWN** key is invalid under the setup interface of this parameter.

P0.04*	Data size	16bit	Data format	DEC
	Modbus address	1008, 1009	CANopen address	0x2004, 0x00

P0.05	JOG speed	Setting range	Default	Unit	Available mode		
		0-1000	200	r/min	P	S	T
<p>This parameter can be used to set the jog speed. For jogging, please refer to chapter 5.2.5.2 During jogging, the ACC/DEC time parameters (P0.54, P0.56, P0.55, and P0.57) are active. The motor will accelerate, decelerate, start and stop according to the settings.</p>							
P0.05	Data size	16bit	Data format	DEC			
	Modbus address	1010, 1011	CANopen address	0x2005, 0x00			

P0.06 <sup>1</sup>	Numerator of frequency division output coefficient	Setting range	Default	Unit	Available mode		
		0-(2 <sup>31</sup> -1)	10000	-	P	S	T
P0.07 <sup>1</sup>	Denominator of frequency division output coefficient	Setting range	Default	Unit	Available mode		
		1-(2 <sup>31</sup> -1)	131072	-	P	S	T

By setting the numerator and denominator of the frequency division output, the signal of the encoder can be frequency divided by any integer or decimal fraction and then outputted through the encoder's pulse output signal terminals(OA+, OA-, OB+ and OB- pin "44""43""41" and "42")

$$\text{Number of drive output pulse} = \frac{\text{P0.06}}{\text{P0.07}} \times \text{encoder resolution}$$

**Note:**

1. In the position control mode, if the encoder output signal of the preceding stage servo motor is used as the position pulse command input of the succeeding stage servo drive, i.e. as start/stop type master-slave follow-up, in order to ensure high positioning accuracy of the succeeding stage servo drive, the frequency division coefficient must be 1:1. Otherwise the accuracy of master-slave position follow-up will be affected in this case.

2. In factory setting, P0.07 is 131072, P0.06 is 10000, which means the output terminal of the encoder will output 10000 pulse signal when the motor rotates a circle. If P0.06 is 5000, the output terminal of the encoder will output 5000 pulse signal.

P0.06 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1012, 1013	CANopen address	0x2006, 0x00			
P0.07 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1014, 1015	CANopen address	0x2007, 0x00			

P0.08 <sup>1</sup>	Reverse of frequency division output	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T

The reverse of B phase can be carried out through this parameter and the phase relation between A phase and B phase can be changed:

Setting value	Logic of B phase	CCW	CW
[0]	Non-reverse		
1	Reverse		

P0.08 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1016, 1017	CANopen address	0x2008, 0x00

P0.09	Torque limit mode setting	Setting range	Default	Unit	Available mode		
		0-6	1	-	P	S	

This parameter is used to set the torque limit mode.

Setting value	Forward direction	Reverse direction
0	Torque limit (analog input 0V-10V)	Torque limit (analog input -10V to +10V)
[1]	Max. torque limit 1 (P0.10)	
2	Max. torque limit 1(P0.10)	Max. torque limit 2(P0.11)
3	TLC OFF →Max. torque limit 1(P0.10) TLC ON → Max. torque limit 2(P0.11)	
4	Forward torque limit (analog input 0V-10V)	Negative torque limit (analog input 0V-10V)
5	Forward torque limit (analog input 0V-10V)	
6	Torque command (analog input 0V-10V)	

**Note:** If P0.09 is 3, the torque switching will not become effective instantly and will be limited by P4.51 and P4.52, the detailed information is shown in the figure below:

P0.09	Data size	16bit	Data format	DEC
	Modbus address	1018, 1019	CANopen address	0x2009, 0x00

P0.10	Max. torque limit 1	Setting range	Default	Unit	Available mode		
		0.0–500.0	300.0	%	P	S	T
P0.11	Max. torque limit 2	Setting range	Default	Unit	Available mode		
		0.0–500.0	300.0	%	P	S	

These parameters can be used to set the maximum torque of the servo motor output. Taking the rated torque of the servo motor as 100%, the setting is the percentage of the rated torque of the servo motor. If the absolute value of the torque command is larger than the value of this parameter, then the actual output torque will be limited by the parameter.

**Note:**

1. These parameters are used with P0.09;
2. In torque mode, the limit value is determined by P0.10.

P0.10	Data size	16bit	Data format	DEC
	Modbus address	1020, 1021	CANopen address	0x200A, 0x00
P0.11	Data size	16bit	Data format	DEC
	Modbus address	1022, 1023	CANopen address	0x200B, 0x00

P0.13 <sup>1</sup>	Power of the external braking resistor	Setting range	Default	Unit	Available mode		
		0–5000	200	W	P	S	T
P0.14 <sup>1</sup>	Resistance of the external braking resistor	Setting range	Default	Unit	Available mode		
		1–1000	60	Ω	P	S	T

When an external braking resistor is connected, this group of parameters should be set with the values equal to the resistance and power of the external braking resistor.

**Note:** Braking overload detection should be used in combination with P4.34, when P4.34 is set to 2, braking overload uses external braking resistor parameter to perform fault detection; please set this group of parameters correctly. If the value of this group of parameters does not match with external braking resistor, braking overload fault (Er07-0) may be reported by mistake or braking resistor may be burnt down. The regenerative braking overload protection time of external braking resistor is in proportion to these two parameters and is in reverse proportion to the braking rate during actual operation.

When P4.34 is set to other values, these two parameters are invalid.

P0.13 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1026, 1027	CANopen address	0x200D, 0x00
P0.14 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1028, 1029	CANopen address	0x200E, 0x00

P0.15	Default monitoring parameters	Setting range	Default	Unit	Available mode		
		0-22	0	-	P	S	T

This parameter is used to set the parameters which can be monitored while powering-on of the system:

Setting value	Parameter meaning	Sign	Unit
[0]	Motor rotation speed	SPdFb	r/min
1	Speed command	SPdcNd	r/min
2	Pulse feedback accumulation	PLSFB	reference unit
3	Pulse command accumulation	PLScNd	reference unit
4	Retention pulse	PLSEr1	reference unit
5	Hybrid control deviation	PLSEr2	reference unit
6	Current torque	trqFb	%
7	Main circuit DC voltage	Ubus1	V
8	Voltage of control power	Ubus2	V
9	Output voltage	Uout	Vrms
10	Output current	Iout	Arms
11	Drive temperature	ndLEnP	°C
12	Torque limit	trqLmt	%
13	Encoder feedback value	EncFb	pulse
14	Rotor position to Z pulse	EncAbs	pulse
15	Load inertia ratio	J-r	%
16	Output power	Power	%
17	Motor load rate	Load-r	%
18	Molecule of actual electronic gear	nUN	-
19	Denominator of actual electronic gear	dEn	-
20	Pulse speed command	PLSSPd	r/min
21	Instant speed	SPdFb1	r/min
22	PTP state	PtPStS	-

P0.15	Data size	16bit	Data format	DEC
	Modbus address	1030,1031	CANopen address	0x200F, 0x00

P0.16	Parameter modification operation locked	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T
This parameter is used to lock the parameter modification function (exclude P0.16 and parameters which cannot be saved after power off) to avoid mis-operation by users.							
		Setting value	Operation	Communication operation			
		[0]	Parameter modification valid	Parameter modification valid			
		1	Parameter modification invalid	Parameter modification invalid			
P0.16	Data size	16bit	Data format	DEC			
	Modbus address	1032, 1033	CANopen address	0x2010, 0x00			

P0.17	EEPROM write mode	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T
This parameter is used to set the EEPROM write mode							
		Setting value	Command pulse input				
		[0]	Saved one by one (automatic saved after modification)				
		1	Bulk saving (be saved in bulk by P4.91 after modification)				
P0.17	Data size	16bit	Data format	DEC			
	Modbus address	1034, 1035	CANopen address	0x2011, 0x00			

P0.18*	Factory password	Setting range	Default	Unit	Available mode		
		0–65536	0	-	P	S	T
This parameter is used to view and modify the menu.							
P0.18*	Data size	16bit	Data format	DEC			
	Modbus address	1036, 1037	CANopen address	0x2012, 0x00			

### 6.1.2 Position control

P0.20 <sup>1</sup>	Position command selection	Setting range	Default	Unit	Available mode		
		0–4	0	-	P		
This parameter is used to select the position command source.							
		Setting value	Position command source				
		[0]	Pulse input				
		1	Communication bus input				
		2	PTP (point-to-point) control				
		3	Reserved				
		4	The second encoder input				
P0.20 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1040, 1041	CANopen address	0x2014, 0x00			

P0.22 <sup>1</sup>	Pulse number per motor resolution	Setting range	Default	Unit	Available mode		
		0–(2 <sup>31</sup> -1)	10000	reference unit	P		
<p>This parameter is used to set the number of pulses per motor resolution.</p> <p><b>Note:</b> P0.22 is set to a non-zero value, the setting of P0.25–P0.29 is invalid. If 17-bit and 20-bit encoder is used, the more pulse number can be set for the higher precision.</p>							
P0.22 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1044, 1045	CANopen address	0x2016, 0x00			

P0.23 <sup>1</sup>	Pulse input form	Setting range	Default	Unit	Available mode		
		0–2	0	-	P		
<p>This parameter is used to set the manner of pulse input.</p> <p>There are 3 types of pulse input manners:</p>							
Setting value	Pulse input form	Signal form	Shown in the picture				
			CCW		CW		
			[0]	Pulse + mode	Pulse+Sign		
1	FWD/REV pulse mode	CW+CCW					
2	Quadrature encoder pulse mode	QEP					
<p>Remark: The pulse direction of the parameter can be reversed by P0.24<sup>1</sup>. Please refer to P0.24<sup>1</sup> for detailed information.</p>							
P0.23 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1046, 1047	CANopen address	0x2017, 0x00			

P0.24 <sup>1</sup>	Reverse of pulse input direction	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
<p>By setting this parameter, the direction of the input pulse can be reversed. At this time the actual output speed direction of the servo drive is opposite to the direction indicated by the pulse input form in P0.23.</p>							
Setting value		Pulse input					
[0]		Pulse input direction does not change					
1		Pulse input direction is opposite to the original input direction					
P0.24 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1048, 1049	CANopen address	0x2018, 0x00			

P0.25	Numerator of 1 <sup>st</sup> electronic gear ratio	Setting range	Default	Unit	Available mode	
		0–(2 <sup>31</sup> -1)	0	-	P	
P0.26 <sup>2</sup>	Denominator of the electronic gear ratio	Setting range	Default	Unit	Available mode	
		1–(2 <sup>31</sup> -1)	10000	-	P	
P0.27	Numerator of 2 <sup>nd</sup> electronic gear ratio	Setting range	Default	Unit	Available mode	
		0–(2 <sup>31</sup> -1)	0	-	P	
P0.28	Numerator of 3 <sup>rd</sup> electronic gear ratio	Setting range	Default	Unit	Available mode	
		0–(2 <sup>31</sup> -1)	0	-	P	
P0.29	Numerator of 4 <sup>th</sup> electronic gear ratio	Setting range	Default	Unit	Available mode	
		0–(2 <sup>31</sup> -1)	0	-	P	

Concept of the electronic gears: for any pulse input, the number and frequency of the pulse actually received by the drive can be changed by multiplying a certain coefficient and this coefficient is electronic gear ratio. It can be indicated in two parts: numerator and denominator:

$$\text{Electronic gear ratio} = g1 / g2;$$

Of which

*g1*: The numerator of the electronic gear ratio;

*g2*: The denominator of the electronic gear ratio;

Below is the schematic diagram of the electronic gear ratio in the system:

**Example:** Below is a case where 1 pulse is

equivalent to a feed rate of 10μm

Mechanical specifications:

Feed of the ball screw *Pb* =10mm;

Reduction ratio *n*=3/5;

Resolution of the servo motor encoder =10000;

At this time calculate the electronic gear ratio:

$$\frac{g1}{g2} = \Delta l_0 \cdot \frac{Pt}{\Delta S} = \Delta l_0 \cdot \frac{Pt}{n \cdot Pb} = 10 \times 10^{-3} \cdot \frac{10000}{(3/5) \cdot 10} = \frac{50}{3}$$

In the formula :

$\Delta l_0$  : Feed rate corresponding to each pulse (mm/pulse);

$\Delta S$  : Feed rate corresponding to each rotation of the motor (mm/rot).

i.e. in this example, *g1*=50, *g2*=3.

Set P0.25 to 50 and P0.26 to 3.

The servo drive has 4 groups of electric gear ratio: P0.25, P0.26, P0.27 and P0.28, P0.29 can

select to adopt which parameter group to provide the electronic gear ratio through the digital input configured as electronic gear ratio selection function (SC1, SC2) on CN1, plug, the corresponding relation is shown below:

SC1	SC2	Position mode
0	0	Numerator of 1 <sup>st</sup> electronic gear ratio
1	0	Numerator of 2 <sup>nd</sup> electronic gear ratio
0	1	Numerator of 3 <sup>rd</sup> electronic gear ratio
1	1	Numerator of 4 <sup>th</sup> electronic gear ratio

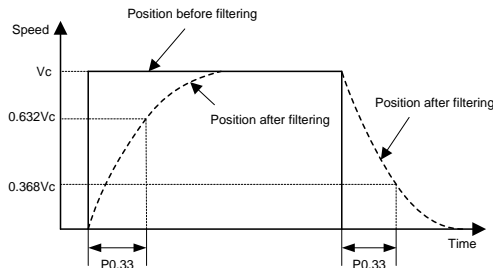

**Note:**

1. The parameters are valid when P0.22<sup>1</sup> is 0.
2. Switch the electronic gear ratio via digital quantity (SC1, SC2), P4.10 must be set to 0.

P0.25	Data size	32bit	Data format	DEC
	Modbus address	1050, 1051	CANopen address	0x2019, 0x00
P0.26 <sup>2</sup>	Data size	32bit	Data format	DEC
	Modbus address	1052, 1053	CANopen address	0x201A, 0x00
P0.27	Data size	32bit	Data format	DEC
	Modbus address	1054, 1055	CANopen address	0x201B, 0x00
P0.28	Data size	32bit	Data format	DEC
	Modbus address	1056, 1057	CANopen address	0x201C, 0x00
P0.29	Data size	32bit	Data format	DEC
	Modbus address	1058, 1059	CANopen address	0x201D, 0x00

P0.33 <sup>2</sup>	Smooth filtering of position command	Setting range	Default	Unit	Available mode		
		0.0–1000.0	0.0	ms	P		

This parameter is used to set the time constant of the low pass filter of the corresponding position and reduce the mechanical shock when the input pulse commands frequency changes. It is shown as the figure below:

P0.33 <sup>2</sup>	Data size	16bit	Data format	DEC
	Modbus address	1066, 1067	CANopen address	0x2021, 0x00

P0.34 <sup>2</sup>	FIR filter of position command	Setting range	Default	Unit	Available mode		
		0.0–1000.0	0.0	ms	P		

This parameter is used to set the time constant of the FIR filter of the corresponding position and

reduce the mechanical shock when the input pulse commands frequency changes. It is shown as the figure below:

**Note:** If the parameter is modified during the operation, it will be valid after stopping.

P0.34 <sup>2</sup>	Data size	16bit	Data format	DEC
	Modbus address	1068, 1069	CANopen address	0x2022, 0x00

P0.35	Software limit of forward position control	Setting range	Default	Unit	Available mode		
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P		

This parameter is used to set the software limit of the forward position control. When P0.35=0 and P0.36=0, the software limit will be invalid.

**Note:** The function is valid when the value defined by P0.35 is larger than P0.36.

P0.35	Data size	32bit	Data format	DEC
	Modbus address	1070, 1071	CANopen address	0x2023, 0x00

P0.36	Software limit of reverse position control	Setting range	Default	Unit	Available mode		
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P		

This parameter is used to set the software limit of the reverse position control. When P0.35=0 and P0.36=0, software limit will be invalid.

**Note:** The function is valid when it is less than P0.35.

P0.36	Data size	32bit	Data format	DEC
	Modbus address	1072, 1073	CANopen address	0x2024, 0x00

P0.37	Position command mode	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		

This parameter is used to set the position command mode when P0.20 is set to 1 and it is invalid for other modes.

Setting value	Position command mode
[0]	Incremental (the position command input is the variation relative to current position)
1	Absolute (the position command input is the target position)

P0.37	Data size	16bit	Data format	DEC
	Modbus address	1074, 1075	CANopen address	0x2025, 0x00

P0.38	Enable fully-closed loop	Setting range	Default	Unit	Available mode		
		0–2	0	-	P		
<p>This parameter is used to enable the fully-closed loop function.</p> <p>When this parameter is set to 2, users can switch between fully-closed loop and semi-closed loop via the IO ports whose function code is 0x34 or 0x134.</p> <p>Note: When this parameter is set to 1 or 2, its definition differs from that of electronic gear ratio during fully-closed loop operation, see details in chapter 7.2.1</p>							
		Set value	Fully-closed loop enable				
		[0]	Disable				
		1	Fully-closed loop enabled				
		2	Enable switching between fully-closed loop and semi-closed loop				
P0.38	Data size	16bit	Data format	DEC			
	Modbus address	1076, 1077	CANopen address	0x2026, 0x00			

**6.1.3 Speed and torque control**

P0.40	Speed command selection	Setting range	Default	Unit	Available mode																																															
		0–5	1	-		S																																														
<p>This parameter is used to select the command source of the speed control:</p>																																																				
	Setting value	Input mode	Instruction																																																	
	0	Internal speed	<p>P3.00–P3.09 can be selected to control the internal multi-step speed (SPD1 is 0x00A, SPD2 is 0x00B, SPD3 is 0x00C):</p> <table border="1"> <thead> <tr> <th>SPD3</th> <th>SPD2</th> <th>SPD1</th> <th>Parameter</th> <th>Speed mode</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>P0.46</td> <td>Internal speed 1</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>P0.47</td> <td>Internal speed 2</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>P0.48</td> <td>Internal speed 3</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>P0.49</td> <td>Internal speed 4</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>P0.50</td> <td>Internal speed 5</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>P0.51</td> <td>Internal speed 6</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>P0.52</td> <td>Internal speed 7</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>P0.53</td> <td>Internal speed 8</td> </tr> </tbody> </table> <p>Please refer to the detailed instruction of P0.46–P0.53.</p>					SPD3	SPD2	SPD1	Parameter	Speed mode	0	0	0	P0.46	Internal speed 1	0	0	1	P0.47	Internal speed 2	0	1	0	P0.48	Internal speed 3	0	1	1	P0.49	Internal speed 4	1	0	0	P0.50	Internal speed 5	1	0	1	P0.51	Internal speed 6	1	1	0	P0.52	Internal speed 7	1	1	1	P0.53	Internal speed 8

	2	Bus input	<p>The speed command from upper PC can be received by the interface of communication bus. When P4.10 is 1, the motor speed can be changed by P4.13.</p> <p>Please refer to the detailed instruction of P4.10 and P4.13.</p>																																																	
	3	Reserved	-																																																	
	4	Reserved	-																																																	
	5	High resolution internal speed	<p>High resolution internal speed, precision 0.1r/min</p>																																																	

P0.40	Data size	16bit	Data format	DEC
	Modbus address	1080, 1081	CANopen address	0x2028, 0x00

P0.41	Setting of speed command direction	Setting range	Default	Unit	Available mode		
		0-1	0	-		S	

This parameter is used to set the forward/reverse direction when P0.40 is 0 and 1 and the speed command sign is selected as S-SIGN.

Setting value	Internal speed step/analog input	Speed command sign	Speed command direction
[0]	Positive speed	0V -10V	No use
	Negative speed	-10V-0V	No use
1	No use	Valid	Forward direction
	No use	Invalid	Reverse direction

P0.41	Data size	16bit	Data format	DEC
	Modbus address	1082, 1083	CANopen address	0x2029, 0x00

P0.42	Analog input 1 gain	Setting range	Default	Unit	Available mode		
		10-2000	100	[P3.26 unit]/V	P	S	T

Set the gain of analog input 1, the unit of the gain is related to the function of P3.26.

Note:

1. Analog input 1 refers to the signal inputted from the analog input 1 terminal (AD1, GND, pin 1 and pin 5) of CN1 plug;
2. Do not apply -10V to +10V voltage between AD1 and GND; otherwise, the drive may be damaged;

Application cases:

1. Suppose the analog input 1 functions is speed command.
2. Set the conversion gain of the corresponding motor command speed of the voltage of analog input 1;
3. When P0.40 is set to "1", this parameter is valid.
4. The relation between analog input 1 voltage and speed command: every 1V corresponds to 100r/min by default;

Actual speed command=analog input voltage×P0.42

**Note:**

1. This parameter is valid when P0.40 is set to "1".
2. Set the parameter correctly after confirming the motor operation condition, if this parameter is set to a large value, the motor speed will fluctuate violently.

P0.42	Data size	32bit	Data format	DEC
	Modbus address	1084, 1085	CANopen address	0x202A, 0x00

P0.43	Analog input 1 reverse	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T

Set the voltage polarity of analog input 1.

Setting value	Actual detection result	
[0]	Positive polarity	[+voltage]→[positive value],[- voltage]→[negative value]
1	Negative polarity	[+voltage]→[negative value],[- voltage]→[positive value]

P0.43	Data size	16bit	Data format	DEC
	Modbus address	1086, 1087	CANopen address	0x202B, 0x00

P0.45	Dead zone of analog input 1	Setting range	Default	Unit	Available mode		
		0.000-3.000	0.000	V	P	S	T

If the absolute value of analog input 1 voltage is within this range, the corresponding command value is 0.

P0.45	Data	16bit	Data format	DEC
	Modbus address	1090, 1091	CANopen address	0x202D, 0x00

P0.46	Internal speed 1/Speed limit 1	Setting range	Default	Unit	Available mode		
		-20000-20000	100	r/min		S	T
P0.47	Internal speed 2/Speed limit 2	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	T
P0.48	Internal speed 3/Speed limit 3	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	T
P0.49	Internal speed 4/Speed limit 4	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	T
P0.50	Internal speed 5	Setting range	Default	Unit	Available mode

P0.51	Internal speed 6	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	
P0.52	Internal speed 7	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	
P0.53	Internal speed 8	Setting range	Default	Unit	Available mode		
		-20000-20000	0	r/min		S	

There are 8 internal speed commands and 4 internal speed limits.

Control mode	P0.40 Setting value	SPD3	SPD2	SPD1	Parameters and setting value
Speed mode	0	0	0	0	P0.46 internal speed 1
		0	0	1	P0.47 internal speed 2
		0	1	0	P0.48 internal speed 3
		0	1	1	P0.49 internal speed 4
		1	0	0	P0.50 internal speed 5
		1	0	1	P0.51 internal speed 6
		1	1	0	P0.52 internal speed 7
		1	1	1	P0.53 internal speed 8
Torque mode	0	0	0	0	P0.46 speed limit 1
		0	0	1	P0.47 speed limit 2
		0	1	0	P0.48 speed limit 3
		0	1	1	P0.49 speed limit 4

**Note:**

- SPD1, SPD2, SPD3 are the digital input of internal command 1–3(0x00A, 0x00B, 0x00C).  
0: OFF (the internal optical coupler corresponding to the input is not conducted);  
1: ON (the internal optical coupler corresponding to the input is conducted)
- The speed limit depends on the absolute value of the parameters and the direction is the same with that of the torque command.

P0.46	Data size	16bit	Data format	DEC
	Modbus address	1092, 1093	CANopen address	0x202E, 0x00
P0.47	Data size	16bit	Data format	DEC
	Modbus address	1094, 1095	CANopen address	0x202F, 0x00
P0.48	Data size	16bit	Data format	DEC
	Modbus address	1096, 1097	CANopen address	0x2030, 0x00
P0.49	Data size	16bit	Data format	DEC
	Modbus address	1098, 1099	CANopen address	0x2031, 0x00
P0.50	Data size	16bit	Data format	DEC
	Modbus address	1100, 1101	CANopen address	0x2032, 0x00
P0.51	Data size	16bit	Data format	DEC
	Modbus address	1102, 1103	CANopen address	0x2033, 0x00
P0.52	Data size	16bit	Data format	DEC
	Modbus address	1104, 1105	CANopen address	0x2034, 0x00
P0.53	Data size	16bit	Data format	DEC
	Modbus address	1106, 1107	CANopen address	0x2035, 0x00

P0.54	ACC time	Setting range	Default	Unit	Available mode		
		0–30000	0	ms		S	
P0.55	DEC time	Setting range	Default	Unit	Available mode		
		0–30000	0	ms		S	

ACC/DEC time is the time needed from 0r/min to the rated (3000r/min by default) speed under the reference command. When the reference speed is higher than or less than the rated speed, the actual ACC/DEC time will be accounted according to the percentage. If the speed is negative, the absolute value will be used to count the time.

**Example:** If the reference speed is 2000r/min, the rated speed is 3000r/min and the ACC/DEC (P0.54, P0.55) time is set to 1500, then the actual ACC time  $t_1$  is  $1500 \times (2000/3000) = 1000\text{ms}$  and the DEC time  $t_2$  is  $1500 \times (2000/3000) = 1000\text{ms}$ . Please refer to the figure below:

**Note:**

1. ACC/DEC time can be used in the speed mode only.

P0.54	Data size	16bit	Data format	DEC
	Modbus address	1108, 1109	CANopen address	0x2036, 0x00
P0.55	Data size	16bit	Data format	DEC
	Modbus address	1110, 1111	CANopen address	0x2037, 0x00

P0.56	ACC time of S curve	Setting range	Default	Unit	Available mode	
		0-1000	0	ms		S
P0.57	DEC time of S curve	Setting range	Default	Unit	Available mode	
		0-1000	0	ms		S

In rated speed command, this parameter is used to set the duration of the circular arc segment during S curve decelerating and thus to achieve the goal of smooth starting. The ACC/DEC time of S curve is shown in the figure below:

**Note:**

1. ACC/DEC time of S curve can be used in speed mode only;
2. If the speed command is analog input, S curve acceleration/deceleration time is invalid;
3. If the setting value of  $P0.54 < P0.56$  and  $P0.56$  is not 0,  $P0.54 = P0.56$  during actual operation;
4. If the setting value of  $P0.55 < P0.57$  and  $P0.57$  is not 0,  $P0.55 = P0.57$  during actual operation.

P0.56	Data size	16bit	Data format	DEC
	Modbus address	1112, 1113	CANopen address	0x2038, 0x00

P0.57	Data size	16bit	Data format	DEC
	Modbus address	1114, 1115	CANopen address	0x2039, 0x00

P0.58	Zero speed clamp mode	Setting range	Default	Unit	Available mode	
		0–3	0	-		S

This parameter is used to set the zero speed clamp mode.

Setting value	Position command mode
[0]	Invalid
1	If the control signal is valid, the speed command is forced to be 0
2	If the control signal is valid, the speed command is forced to be 0 and when the actual speed of the motor is below P0.59, it will switch to position control and be locked in the position. Other actions are the same with setting value 1.
3	If the control signal is valid, when the speed command changes to be -10r/min below P0.59, it will switch to position control and be locked in the position.

**Note:**

1. If any one of P3.00–P3.09 is zero speed clamp function (0x00D), it can be controlled by the corresponding digital input of CN1; it can also be controlled by P4.19:

0: Disabled; 1: Enabled

2. In the torque mode, mode 0 and 1 are valid, mode 2 and 3 are the same with mode 1.

P0.58	Data size	16bit	Data format	DEC
	Modbus address	1116, 1117	CANopen address	0x203A, 0x00

P0.59	Speed threshold of zero speed clamp	Setting range	Default	Unit	Available mode	
		10–20000	30	r/min		S

This parameter is used to set the position when P0.58 is 2 or 3. When P0.58 is 3, there is 10r/min delay when detection.

P0.59	Data size	16bit	Data format	DEC
	Modbus address	1118, 1119	CANopen address	0x203B, 0x00

P0.60	Torque command selection	Setting range	Default	Unit	Available mode	
		0–3	1	-		T

This parameter is used to set the command source of the torque control.

Setting value	Input method	Instruction
0	Internal setting	Set the torque command by P0.66.
[1]	Analog input	It is required to set P3.26, P3.27 or P3.70 to 4, and set related parameters according to actual conditions.
2	Bus input	The torque command can be received by the communication bus interface. When P4.10 is 1, the motor torque can be changed by P4.14. Please refer to the detailed instruction of P4.10 and P4.14.
3	Reserved	-

P0.60	Data size	16bit	Data format	DEC
	Modbus address	1120, 1121	CANopen address	0x203C, 0x00

P0.61	Torque command direction setting	Setting range	Default	Unit	Available mode		
		0-1	0	-			T

This parameter is used to select the torque command direction.

Setting value	Designated method
[0]	The direction is designated by the torque command sign. For example: torque command input [+] $\rightarrow$ Positive direction, [-] $\rightarrow$ Negative direction
1	Determined by [0x00F] 1: Positive direction; 0:Negative direction

**Note:** 0x00F is valid when input low electric level and it is 0x10F when high electric level is valid.

P0.61	Data size	16bit	Data format	DEC
	Modbus address	1122, 1123	CANopen address	0x203D, 0x00

P0.62	Analog input 2 gain	Setting range	Default	Unit	Available mode		
		0-2000	100	[P3.27 unit]/V	P	S	T

Set the gain of analog input 2, the unit of the gain is related to the function of P3.27.

Note:

1. Analog input 2 refers to the signal inputted from the analog speed/speed limit terminal (AD2, GND, pin 20 and pin 19) of CN 1 plug.

Application case:

1. Suppose analog input 2 functions is torque command.
2. Set the conversion gain of the corresponding motor torque command of analog input 2 voltage.
3. When P0.60 is set to "1", this parameter is valid.
4. The relation between analog input 2 voltage and torque command: every 1V corresponds to 10% of the rated torque by default.

Actual torque command = analog input voltage  $\times$  P0.62

**Note:**

Set the parameter correctly after confirming the motor operation condition, if the setting value is too large, the motor torque will fluctuate violently.

P0.62	Data size	32bit	Data format	DEC
	Modbus address	1124, 1125	CANopen address	0x203E, 0x00

P0.63	Analog input 2 reverse	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

Set the voltage polarity of analog input 2.

Setting value	Motor direction	
[0]	Positive polarity	[+voltage]→[positive value],[ - voltage]→[negative value]
1	Negative polarity	[+voltage]→[negative value],[ - voltage]→[positive value]

P0.63	Data size	16bit	Data format	DEC
	Modbus address	1126, 1127	CANopen address	0x203F, 0x00

P0.65	Dead zone of analog input 2	Setting range	Default	Unit	Available mode		
		0.000–3.000	0.000	V	P	S	T

If the absolute value of analog input 2 voltage is within this range, the corresponding command value is 0.

P0.65	Data size	16bit	Data format	DEC
	Modbus address	1130, 1131	CANopen address	0x2041, 0x00

P0.66	Internal torque command	Setting range	Default	Unit	Available mode		
		-500.0–500.0	0.0	%			T

Set internal torque reference value via this parameter and take the rated torque of servo motor as 100%. This set value is the percentage value of rated torque of servo motor.

**Note:**

1. If the absolute value of this parameter is larger than the max. torque limit 1 (P0.10), then the output torque is the setting value of P0.10, the direction is the same with this parameter.
2. In the torque mode, this parameter is valid when the setting value of P0.60 is "0".

P0.66	Data size	16bit	Data format	DEC
	Modbus address	1132, 1133	CANopen address	0x2042, 0x00

P0.67	Speed limit mode setting	Setting range	Default	Unit	Available mode		
		0–1	1	-			T

In the torque control mode, this parameter is used to set the speed limit mode.

Setting value	Designated method
0	Select the analog input as the speed limit source. It is required to set P3.26 [analog input 1 function], P3.27 [analog input 2 function] or P3.70 [analog input 3 function] to 1 [speed limit], and set related parameters according to actual conditions.
[1]	Select the internal speed limit and anyone of P0.46–P0.49 may be selected

**Note:** The speed limit value is processed with absolute value internally. The actual sign of speed limit is the same with that of the torque command.

P0.67	Data size	16bit	Data format	DEC
	Modbus address	1134, 1135	CANopen address	0x2043, 0x00

P0.68	RAMP time of torque command	Setting range	Default	Unit	Available mode		
		0–10000	0	ms			T

This parameter is used to modify the planning curve when the torque command input changes, and it is the rising time from 0 to 100% of rated torque.

P0.68	Data size	16bit	Data format	DEC			
	Modbus address	1136, 1137	CANopen address	0x2044, 0x00			

P0.69	DEC time of fast stop	Setting range	Default	Unit	Available mode		
		0–10000	500	ms	P	S	T

This parameter is used to modify the DEC time in fast stop mode, and it is the DEC time from 100% rated speed to 0.

P0.69	Data size	16bit	Data format	DEC			
	Modbus address	1138, 1139	CANopen address	0x2045, 0x00			

P0.70 <sup>1</sup>	Absolute encoder mode setting	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter is used to modify the operation mode of the multi-turn absolute encoder. When the matching encoder for the motor is multi-turn absolute encoder, it will be taken as single-turn encoder by default; when multi-turn function is needed, it is necessary to prepare the spare battery and set it as the multi-turn modes.

Setting value	Method
[0]	Single circle
1	Multiple circles

P0.70 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1140, 1141	CANopen address	0x2046, 0x00			

P0.71*	Absolute encoder multi-turn zeroing	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

Clear the multi-turn absolute encoder via this parameter. The multi-turn data of the encoder will be cleared after this parameter is enabled while the single-turn data will remain unchanged, however, the absolute position feedback of the system will be cleared.

**Note:** When using multi-turn absolute encoder, after machinery installation is done, please clear the absolute encoder after detecting absolute zero position of the mechanic system at initial power up.

P0.71*	Data size	16bit	Data format	DEC			
	Modbus address	1142, 1143	CANopen address	0x2047, 0x00			

#### 6.1.4 Control mode switching

P0.90	Max. speed limit of control mode switching	Setting range	Default	Unit	Available mode		
		1–1000	100	r/min	P	S	T

Set the max. running speed during positioning when switching from speed mode or torque mode

to position mode under position/speed, position/torque compound mode.				
P0.90	Data size	16bit	Data format	DEC
	Modbus address	1180, 1181	CANopen address	0x205A, 0x00

P0.91	Positioning reference of control mode switching	Setting range	Default	Unit	Available mode		
		-1-(2 <sup>31</sup> -1)	-1	pulse	P	S	T
Set the motor positioning position R0.14 [rotor position relative to Z pulse] after control mode switching is done when switching from speed mode or torque mode to position mode under position/speed, position/torque compound mode.							
<b>Note:</b>							
1. After the switching, the reference point of the received position command is the setting value of the parameter and the unit is the unit of the encoder pulse.							
2. When it is set to -1 and switches from speed mode to position mode, there is no positioning action and it will switch at the current position.							
3. If the mechanical angle of P3.50 is no more than 0.5°, then the positioning precision is ±P3.50; if the angle is larger than 0.5°, then the positioning precision is the pulse number of ±0.5°.							
P0.91	Data size	32bit	Data format	DEC			
	Modbus address	1182, 1183	CANopen address	0x205B, 0x00			

P0.92	Position mode switching exit mode	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
When P0.03 is 3 or 4, this parameter is used to set the exiting mode when the position mode can be switched to other control modes.							
Setting value		Exiting mode					
[0]		Switch from position mode to other mode after positioning					
1		Switch to other mode when the control mode switching command is invalid					
P0.92	Data size	32bit	Data format	DEC			
	Modbus address	1184, 1185	CANopen address	0x205C, 0x00			

### 6.1.5 Speed display filter

P0.99	FIR filter level of speed detection	Setting range	Default	Unit	Available mode		
		1-31	1	-	P	S	T
Set the FIR filter level displayed by R0.00 [motor speed]. When it is set to 1 (default value), there is no filter. The larger the set value, the smoother the speed display.							
P0.99	Data size	16bit	Data format	DEC			
	Modbus address	1198, 1199	CANopen address	0x2063, 0x00			

## 6.2 Autotuning control parameters (P1)

### 6.2.1 Inertia identification (Automatic gain)

P1.00	Inertia online automatic estimation	Setting range	Default	Unit	Available mode		
		0–1	0	%	P	S	T

This parameter is used to set whether to adjust the inertia ratio and adjust the gain automatically.

Setting value	Meaning
[0]	Invalid
1	Valid

P1.00	Data size	16bit	Data format	DEC
	Modbus address	1200, 1201	CANopen address	0x2100, 0x00

P1.01	1 <sup>st</sup> inertia ratio	Setting range	Default	Unit	Available mode		
		0–10000	250	%	P	S	T

Rotation inertia ratio = Load inertia / motor rotation inertia x 100%,

If P1.01 is set correctly, the setting unit of P2.00 and P2.05 is Hz.

If P1.01 is larger than the actual value, the speed loop gain unit will increase, and if it is smaller than the actual value, the speed loop gain unit will decrease.

If the online adjustment is valid, the real time inertia ratio will be updated to P1.01 and saved into EEPROM every 30 minutes.

P1.01	Data size	16bit	Data format	DEC
	Modbus address	1202, 1203	CANopen address	0x2101, 0x00

P1.02	2 <sup>nd</sup> inertia ratio	Setting range	Default	Unit	Available mode		
		0–10000	250	%	P	S	T

The definition is the same as P1.01.

**Note:** The automatic online gain adjustment is invalid for this parameter.

P1.02	Data size	16bit	Data format	DEC
	Modbus address	1204, 1205	CANopen address	0x2102, 0x00

P1.03	Machine rigidity setting	Setting range	Default	Unit	Available mode		
		0–31	13	-	P	S	T

The bigger the value is the faster response and higher rigidity and easier vibration. In stable system, higher rigidity setting makes fast response.

Mechanical structure	Rigidity set
Big handling, transmission equipment	0–13
Belt drive mechanism	5–16
Ball screw + Belt drive	5–16
Manipulator	15–22
Direct ball screw or rigid bodies	18–25

P1.03	Data size	16bit	Data format	DEC
	Modbus address	1206, 1207	CANopen address	0x2103, 0x00

P1.04	Inertia offline automatic estimation	Setting range	Default	Unit	Available mode												
		0–1	0	-	P	S	T										
<p>The load inertial ratio of motor rotation inertia can be gained by setting this parameter. After setting the inertia identification, the motor will run 6 cycles to carry out the inertia identification. In each cycle, the motor will run at the mode of P1.05, the maximum rotation cycles are determined by P1.06 and the ACC command time is determined by P1.07.</p> <table border="1"> <thead> <tr> <th>Setting value</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>[0]</td> <td>Inertia identification switch off</td> </tr> <tr> <td>1</td> <td>Inertia identification switch on</td> </tr> </tbody> </table>								Setting value	Function	[0]	Inertia identification switch off	1	Inertia identification switch on				
Setting value	Function																
[0]	Inertia identification switch off																
1	Inertia identification switch on																
<b>Note:</b>																	
1. The motor speed during identification will be faster if the value of P1.06 and P1.07 are bigger.																	
2. Refer to chapter 10.1 if the drive reports Er25-7.																	
3. This parameter is invalid in the servo enabling state.																	
P1.04*	Data size	16bit	Data format	DEC													
	Modbus address	1208, 1209	CANopen address	0x2104, 0x00													
P1.05	Operation mode of inertia identification	Setting range	Default	Unit	Available mode												
		0–3	0	-	P	S	T										
<p>This parameter is used to set the operation mode of inertia identification.</p> <table border="1"> <thead> <tr> <th>Setting value</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>[0]</td> <td>Forward rotation and then reverse rotation</td> </tr> <tr> <td>1</td> <td>Forward rotation</td> </tr> <tr> <td>2</td> <td>Reverse rotation</td> </tr> <tr> <td>3</td> <td>Reverse rotation and then forward rotation</td> </tr> </tbody> </table>								Setting value	Function	[0]	Forward rotation and then reverse rotation	1	Forward rotation	2	Reverse rotation	3	Reverse rotation and then forward rotation
Setting value	Function																
[0]	Forward rotation and then reverse rotation																
1	Forward rotation																
2	Reverse rotation																
3	Reverse rotation and then forward rotation																
P1.05	Data size	16bit	Data format	DEC													
	Modbus address	1210, 1211	CANopen address	0x2105, 0x00													
P1.06	Movable range of inertia identification	Setting range	Default	Unit	Available mode												
		0.2–20.0	2.0	r	P	S	T										
<p>In the position mode, this parameter is used to limit the maximum circle number in each cycle.</p>																	
P1.06	Data size	16bit	Data format	DEC													
	Modbus address	1212, 1213	CANopen address	0x2106, 0x00													
P1.07	ACC time constant of inertia identification	Setting range	Default	Unit	Available mode												
		2–1000	200	ms	P	S	T										
<p>This parameter is used to set the motor ACC time during the inertia identification. If the load inertia is large, the ACC time can be set to a large value to avoid the overload alarm.</p>																	
P1.07	Data size	16bit	Data format	DEC													
	Modbus address	1214, 1215	CANopen address	0x2107, 0x00													

P1.08	Speed level of inertia identification	Setting range	Default	Unit	Available mode																	
		0–3	1	-	P	S	T															
<p>This parameter is used to set the speed level of inertia identification.</p> <p>The larger the setting value, the faster the response and larger fluctuation of the presumption value. The presumption result can be saved every 30 minutes.</p> <table border="1"> <thead> <tr> <th>Setting value</th> <th>Function</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>No change</td> <td>Stop the presumption of load characteristic</td> </tr> <tr> <td>[1]</td> <td>No change basically</td> <td>No change to the load characteristic</td> </tr> <tr> <td>2</td> <td>Change slowly</td> <td>Slow change to the load characteristic</td> </tr> <tr> <td>3</td> <td>Change fast</td> <td>Rapid change to the load characteristic</td> </tr> </tbody> </table>								Setting value	Function	Meaning	0	No change	Stop the presumption of load characteristic	[1]	No change basically	No change to the load characteristic	2	Change slowly	Slow change to the load characteristic	3	Change fast	Rapid change to the load characteristic
Setting value	Function	Meaning																				
0	No change	Stop the presumption of load characteristic																				
[1]	No change basically	No change to the load characteristic																				
2	Change slowly	Slow change to the load characteristic																				
3	Change fast	Rapid change to the load characteristic																				
P1.08	Data size	16bit	Data format	DEC																		
	Modbus address	1216, 1217	CANopen address	0x2108, 0x00																		

### 6.2.2 Self-adaptive vibration control

P1.19	Valid resonance detection bit	Setting range	Default	Unit	Available mode		
		0.2–100.0	5.0	%	P	S	T
<p>This parameter is used to set the sensitivity of the automatic detection on mechanical resonance frequency. The smaller the value, the higher sensitivity to the resonance.</p> <p><b>Note:</b> When the set value of P1.19 is increasing, the sensitivity to the resonance is reducing.</p>							
P1.19	Data size	16bit	Data format	DEC			
	Modbus address	1238, 1239	CANopen address	0x2113, 0x00			

P1.20	Resonance detection mode	Setting range	Default	Unit	Available mode																				
		0–7	0	-	P	S	T																		
<p>This parameter is used to set the working mode of resonance detection and the resonance frequency number presumed by self-adaptive notch filter as well as the action after presumption. If the function is valid (1, 2, 3), the system will automatically collect data to conduct mechanical resonance frequency analysis and the result is saved in P1.21 and P1.22. Users can set the frequency of notch filter according to P1.21 and P1.22 to eliminate the mechanical resonance.</p> <p><b>Note:</b> The setting value is invalid after gain adjustment.</p> <table border="1"> <thead> <tr> <th>Setting value</th> <th>Function</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>[0]</td> <td>Invalid</td> <td>All parameters related to notch filter remain unchanged</td> </tr> <tr> <td>1</td> <td>one notch filter valid</td> <td>The parameters related to 3<sup>rd</sup> notch filter will be updated according to the self-adaptive result.</td> </tr> <tr> <td>2</td> <td>two notch filters valid</td> <td>The parameters related to 3<sup>rd</sup> and 4<sup>th</sup> notch filters will be updated according to the self-adaptive result.</td> </tr> <tr> <td>3</td> <td>Resonance frequency test mode</td> <td>Detect mechanical resonance frequency automatically but does not set the parameters related to notch filter.</td> </tr> <tr> <td>4</td> <td>Notch filter parameters clear</td> <td>Restore to the default values</td> </tr> </tbody> </table>								Setting value	Function	Meaning	[0]	Invalid	All parameters related to notch filter remain unchanged	1	one notch filter valid	The parameters related to 3 <sup>rd</sup> notch filter will be updated according to the self-adaptive result.	2	two notch filters valid	The parameters related to 3 <sup>rd</sup> and 4 <sup>th</sup> notch filters will be updated according to the self-adaptive result.	3	Resonance frequency test mode	Detect mechanical resonance frequency automatically but does not set the parameters related to notch filter.	4	Notch filter parameters clear	Restore to the default values
Setting value	Function	Meaning																							
[0]	Invalid	All parameters related to notch filter remain unchanged																							
1	one notch filter valid	The parameters related to 3 <sup>rd</sup> notch filter will be updated according to the self-adaptive result.																							
2	two notch filters valid	The parameters related to 3 <sup>rd</sup> and 4 <sup>th</sup> notch filters will be updated according to the self-adaptive result.																							
3	Resonance frequency test mode	Detect mechanical resonance frequency automatically but does not set the parameters related to notch filter.																							
4	Notch filter parameters clear	Restore to the default values																							

	5	3 <sup>rd</sup> notch filter→1 <sup>st</sup> notch filter	Copy the parameters of 3 <sup>rd</sup> notch filter to 1 <sup>st</sup> notch filter and then restore the parameter of 3 <sup>rd</sup> notch filter to the default values			
	6	4 <sup>th</sup> notch filter→2 <sup>nd</sup> notch filter	Copy the parameters of 4 <sup>th</sup> notch filter to 1 <sup>st</sup> notch filter and then restore the parameter of 4 <sup>th</sup> notch filter to the default values			
	7	3 <sup>rd</sup> and 4 <sup>th</sup> notch filter→1 <sup>st</sup> and 2 <sup>nd</sup> notch filter	Copy the parameters of 3 <sup>rd</sup> and 4 <sup>th</sup> notch filter to 1 <sup>st</sup> and 2 <sup>nd</sup> notch filter and then restore the parameter of 3 <sup>rd</sup> and 4 <sup>th</sup> notch filter to the default values			
P1.20	Data size		16bit	Data format		DEC
	Modbus address		1240, 1241	CANopen address		0x2114, 0x00

P1.21*	1 <sup>st</sup> mechanical resonance frequency	Setting range	Default	Unit	Available mode		
		0-5000	5000	Hz	P	S	T
P1.22*	2 <sup>nd</sup> mechanical resonance frequency	Setting range	Default	Unit	Available mode		
		0-5000	5000	Hz	P	S	T

This parameter is used to display the resonance frequency. When P1.20 is set to "1", the system will detect the frequency of the max. resonance point and display it by function codes.

**Note:**

1. Only when the speed reaches above 30r/min will the measuring value be correct.
2. This function is only for read and cannot be set. The user can set the frequency of notch filter according to the function code to remove the mechanical resonance.
3. 5000 indicates the resonance point is not found.

P1.21	Data size		16bit	Data format		DEC
	Modbus address		1242, 1243	CANopen address		0x2115, 0x00
P1.22	Data size		16bit	Data format		DEC
	Modbus address		1244, 1245	CANopen address		0x2116, 0x00

P1.23	1 <sup>st</sup> notch filter frequency	Setting range	Default	Unit	Available mode		
		50-5000	5000	Hz	P	S	T

This parameter is used to set the frequency of 1<sup>st</sup> notch filter for suppressing resonance. The notch filter can simulate the mechanical resonant frequency and thus suppressing the resonant frequency.

When this parameter is set to 5000, the function of notch filter will be invalid.

P1.23	Data size		16bit	Data format		DEC
	Modbus address		1246, 1247	CANopen address		0x2117, 0x00

P1.24	1 <sup>st</sup> notch filter Q value	Setting range	Default	Unit	Available mode		
		0.50-16.00	1.00	-	P	S	T

This parameter is used to set the Q value (quality factor) of 1<sup>st</sup> notch filter  
 $Q = \text{Center frequency of 1}^{\text{st}} \text{ notch filter} / \text{bandwidth of the notch}$ . Generally, this parameter should remain in default value.

P1.24	Data size		16bit	Data format		DEC
	Modbus address		1248, 1249	CANopen address		0x2118, 0x00

P1.25	1 <sup>st</sup> notch filter depth selection	Setting range	Default	Unit	Available mode		
		0–100	0	%	P	S	T

This parameter is used to set the amplitude attenuation rate of 1<sup>st</sup> notch filter.

When the setting value increases, the notch filter depth becomes shallow and phase lag will be smaller.

P1.25	Data size	16bit	Data format	DEC		
	Modbus address	1250, 1251	CANopen address	0x2119, 0x00		

P1.26	2 <sup>nd</sup> notch filter frequency	Setting range	Default	Unit	Available mode		
		50–5000	5000	Hz	P	S	T
P1.27	2 <sup>nd</sup> notch filter Q value	Setting range	Default	Unit	Available mode		
		0.50–16.00	1.00	-	P	S	T
P1.28	2 <sup>nd</sup> notch filter depth selection	Setting range	Default	Unit	Available mode		
		0–100	0	%	P	S	T

Refer to P1.23, P1.24 and P1.25 for detailed parameters setting.

P1.26	Data size	16bit	Data format	DEC		
	Modbus address	1252, 1253	CANopen address	0x211A, 0x00		
P1.27	Data size	16bit	Data format	DEC		
	Modbus address	1254, 1255	CANopen address	0x211B, 0x00		
P1.28	Data size	16bit	Data format	DEC		
	Modbus address	1256, 1257	CANopen address	0x211C, 0x00		

P1.29	3 <sup>rd</sup> notch filter frequency	Setting range	Default	Unit	Available mode		
		50–5000	5000	Hz	P	S	T
P1.30	3 <sup>rd</sup> notch filter Q value	Setting range	Default	Unit	Available mode		
		0.50–16.00	1.00	-	P	S	T
P1.31	3 <sup>rd</sup> notch filter depth selection	Setting range	Default	Unit	Available mode		
		0–100	0	%	P	S	T

Refer to P1.23, P1.24 and P1.25 for detailed parameters setting.

P1.29	Data size	16bit	Data format	DEC		
	Modbus address	1258, 1259	CANopen address	0x211D, 0x00		
P1.30	Data size	16bit	Data format	DEC		
	Modbus address	1260, 1261	CANopen address	0x211E, 0x00		
P1.31	Data size	16bit	Data format	DEC		
	Modbus address	1262, 1263	CANopen address	0x211F, 0x00		

P1.32	4 <sup>th</sup> notch filter frequency	Setting range	Default	Unit	Available mode		
		50–5000	5000	Hz	P	S	T
P1.33	4 <sup>th</sup> notch filter Q value	Setting range	Default	Unit	Available mode		
		0.50–16.00	1.00	-	P	S	T
P1.34	4 <sup>th</sup> notch filter depth selection	Setting range	Default	Unit	Available mode		
		0–100	0	%	P	S	T

Refer to P1.23, P1.24 and P1.25 for detailed parameters setting.				
P1.32	Data size	16bit	Data format	DEC
	Modbus address	1264, 1265	CANopen address	0x2120, 0x00
P1.33	Data size	16bit	Data format	DEC
	Modbus address	1266, 1267	CANopen address	0x2121, 0x00
P1.34	Data size	16bit	Data format	DEC
	Modbus address	1268, 1269	CANopen address	0x2122, 0x00

P1.35	Vibration control mode of position command	Setting range	Default	Unit	Available mode		
		0–2	0	-	P		

This parameter is used to set the switching mode of the filter used for vibration control.

Setting value	Function
[0]	The 1 <sup>st</sup> vibration control is valid
1	Switch between 1 and 2 according to VS-SEL
2	Automatic

**Note:** When selecting by digital input terminals, it is necessary to configure one of P3.00–P3.09 with 0x11C or 0x01C (VS-SEL).

Relation with COM-:

0:OFF (the internal optical coupler corresponding to the input is not conducted);

1:ON (the internal optical coupler corresponding to the input is conducted).

P1.35	Data size	16bit	Data format	DEC
	Modbus address	1270, 1271	CANopen address	0x2123, 0x00

P1.36	1 <sup>st</sup> vibration control frequency	Setting range	Default	Unit	Available mode		
		0.0–200.0	0.0	Hz	P		

It is used to set the frequency point used to suppress the vibration at the peak of the load.

**Note:** Invalid if the setting value is below 1.0Hz.

P1.36	Data size	16bit	Data format	DEC
	Modbus address	1272, 1273	CANopen address	0x2124, 0x00

P1.37	1 <sup>st</sup> vibration control filter factor	Setting range	Default	Unit	Available mode		
		0.00–1.00	1.00	-	P		

This parameter is used to set the filter factor of 1<sup>st</sup> vibration control filter.

P1.37	Data size	16bit	Data format	DEC
	Modbus address	1274, 1275	CANopen address	0x2125, 0x00

P1.38	2 <sup>nd</sup> vibration control frequency	Setting range	Default	Unit	Available mode		
		0.0–200.0	0.0	Hz	P		

P1.39	2 <sup>nd</sup> vibration control filter factor	Setting range	Default	Unit	Available mode		
		0.00–1.00	1.00	-	P		

Refer to P1.36 and P1.37 for the detailed information.

P1.38	Data size	16bit	Data format	DEC
	Modbus address	1276, 1277	CANopen address	0x2126, 0x00
P1.39	Data size	16bit	Data format	DEC
	Modbus address	1278, 1279	CANopen address	0x2127, 0x00

## 6.3 Motor control parameters (P2)

### 6.3.1 Gain setting

P2.00	1 <sup>st</sup> speed gain	Setting range	Default	Unit	Available mode		
		0.1–3276.7	27.0	Hz	P	S	T

The responsiveness of the servo system speed loop is determined by the speed gain. When increase the value of P2.00, the speed response will be improved, but it may easily cause vibration and noise.

**Note:** If the inertia ratio is set correctly, the unit of P2.00 is Hz.

P2.00	Data size	16bit	Data format	DEC
	Modbus address	1400, 1401	CANopen address	0x2200, 0x00

P2.01	1 <sup>st</sup> speed integral time constant	Setting range	Default	Unit	Available mode		
		0.1–1000.0	21.0	ms	P	S	T

This parameter is used to set the integral time constant of the speed loop. Decreasing the setting value may improve the response, but it may easily cause vibration and noise. It should be noted particularly that when this parameter is set to 1000, it means the integral action is invalid.

P2.01	Data size	16bit	Data format	DEC
	Modbus address	1402, 1403	CANopen address	0x2201, 0x00

P2.02	1 <sup>st</sup> position gain	Setting range	Default	Unit	Available mode		
		0.0–3276.7	48.0	1/s	P		

The responsiveness of servo system position loop is determined by the position gain. Increasing the setting value may improve the position responsiveness and shorten the positioning time, but it may easily cause vibration and noise.

P2.02	Data size	16bit	Data format	DEC
	Modbus address	1404, 1405	CANopen address	0x2202, 0x00

P2.03	1 <sup>st</sup> speed detection filter	Setting range	Default	Unit	Available mode		
		100–5000	5000	Hz	P	S	T

This parameter is used to set 1<sup>st</sup> speed detection filter.

**Note:** 5000 means there is no filter. Setting this parameter to a small value may reduce motor noise and speed fluctuation, but it also lower down the responsiveness.

P2.03	Data size	16bit	Data format	DEC
	Modbus address	1406, 1407	CANopen address	0x2203, 0x00

P2.04	1 <sup>st</sup> torque filter	Setting range	Default	Unit	Available mode		
		0.00–25.00	0.84	ms	P	S	T
This parameter is used to set the time constant of torque filter.							
P2.04	Data size	16bit	Data format	DEC			
	Modbus address	1408, 1409	CANopen address	0x2204, 0x00			

P2.05	2 <sup>nd</sup> speed gain	Setting range	Default	Unit	Available mode		
		0.0–3276.7	27.0	Hz	P	S	T
P2.06	2 <sup>nd</sup> speed integral time constant	Setting range	Default	Unit	Available mode		
		0.1–1000.0	1000.0	ms	P	S	T
P2.07	2 <sup>nd</sup> position gain	Setting range	Default	Unit	Available mode		
		0.0–3276.7	57.0	1/s	P		
P2.08	2 <sup>nd</sup> speed detection filter	Setting range	Default	Unit	Available mode		
		100–5000	5000	Hz	P	S	T
P2.09	2 <sup>nd</sup> torque filter	Setting range	Default	Unit	Available mode		
		0.00–25.00	0.84	ms	P	S	T

There are two groups of parameters respectively for position gain, speed gain and speed integral time constant, speed detection filter and torque filter.

The definition of the function and content are the same with those of 1<sup>st</sup> group.

The user can select or switch between 1<sup>st</sup> gain and 2<sup>nd</sup> gain as needed. Please refer to the detailed information of P2.20 and P2.34.

P2.05	Data size	16bit	Data format	DEC			
	Modbus address	1410, 1411	CANopen address	0x2205, 0x00			
P2.06	Data size	16bit	Data format	DEC			
	Modbus address	1412, 1413	CANopen address	0x2206, 0x00			
P2.07	Data size	16bit	Data format	DEC			
	Modbus address	1414, 1415	CANopen address	0x2207, 0x00			
P2.08	Data size	16bit	Data format	DEC			
	Modbus address	1416, 1417	CANopen address	0x2208, 0x00			
P2.09	Data size	16bit	Data format	DEC			
	Modbus address	1418, 1419	CANopen address	0x2209, 0x00			

P2.10	Speed feed-forward gain	Setting range	Default	Unit	Available mode		
		0.0–100.0	0.0	%	P		
This parameter is used to set the speed feed-forward gain. When the parameter is 100%, the retention pulse running at a certain speed will be almost zero; sudden ACC/DEC will enlarge overshooting.							
P2.10	Data size	16bit	Data format	DEC			
	Modbus address	1420, 1421	CANopen address	0x220A, 0x00			

P2.11	Speed feed-forward filter time	Setting range	Default	Unit	Available mode		
		0.00–64.00	0.50	ms	P		
This parameter is used to set the speed feed-forward filter time.							
P2.11	Data size	16bit	Data format	DEC			
	Modbus address	1422, 1423	CANopen address	0x220B, 0x00			
P2.12	Torque feed-forward gain	Setting range	Default	Unit	Available mode		
		0.0–100.0	0.0	%	P	S	
This parameter is used to set the torque feed-forward gain. After the torque command calculated according to speed control command multiplies the rate of the parameter, add to the torque command from speed control step. Increasing torque feed-forward gain can improve response performance in ACC/DEC and reduce position deviation.							
P2.12	Data size	16bit	Data format	DEC			
	Modbus address	1424, 1425	CANopen address	0x220C, 0x00			
P2.13	Torque feed-forward filter time	Setting range	Default	Unit	Available mode		
		0.00–64.00	0.00	ms	P	S	
This parameter is used to set the torque feed-forward filter time.							
P2.13	Data size	16bit	Data format	DEC			
	Modbus address	1426, 1427	CANopen address	0x220D, 0x00			
P2.14	1 <sup>st</sup> IPPI coefficient	Setting range	Default	Unit	Available mode		
		0–1000	100	%	P	S	T
This parameter is used to set 1 <sup>st</sup> IPPI coefficient. <b>Note:</b> IP control will be applied when it is set to 0 and PI control will be applied when it is set to 100.							
P2.14	Data size	16bit	Data format	DEC			
	Modbus address	1428, 1429	CANopen address	0x220E, 0x00			
P2.15	2 <sup>nd</sup> IPPI coefficient	Setting range	Default	Unit	Available mode		
		0–1000	100	%	P	S	T
This parameter is used to set 2 <sup>nd</sup> IPPI coefficient. <b>Note:</b> IP control will be applied when it is set to 0 and PI control will be applied when it is set to 100.							
P2.15	Data size	16bit	Data format	DEC			
	Modbus address	1430, 1431	CANopen address	0x220F, 0x00			

## 6.3.2 Gain switching

P2.20	2 <sup>nd</sup> gain setting	Setting range	Default	Unit	Available mode		
		0–1	1	-	P	S	T

This parameter is used to set the right adjustment.

Setting value	Mode
0	1 <sup>st</sup> gain is fixed. Gain switching invalid→PI action Gain switching valid→P action <b>Note:</b> 0x006 is the digital input low level valid and the high level valid is 0x106.
[1]	Valid between 1 <sup>st</sup> gain [P2.00–P2.04] and 2 <sup>nd</sup> gain [P2.05–P2.09].

P2.20	Data size	16bit	Data format	DEC
	Modbus address	1440, 1441	CANopen address	0x2214, 0x00

P2.22	Position control switching mode	Setting range	Default	Unit	Available mode		
		0–9	0	-	P		

This parameter is used to set the triggering condition of gain switching during position control or fully-closed-loop control.

Setting value	Switching condition	Gain condition
[0]	1 <sup>st</sup> gain fixed	Be fixed in 1 <sup>st</sup> gain [P2.00–P2.04]
1	2 <sup>nd</sup> gain fixed	Be fixed in 2 <sup>nd</sup> gain [P2.05–P2.09]
2	Switching input with gain	Invalid: 1 <sup>st</sup> gain Valid: 2 <sup>nd</sup> gain
3	Large torque command	In the previous 1 <sup>st</sup> gain, if the absolute value of torque command exceed (level+delay) [0.1%], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of torque command keeps below (level-delay) [0.1%] in the delay time, it will return to 1 <sup>st</sup> gain.
4	Large speed command	In the previous 1 <sup>st</sup> gain, if the absolute value of the speed command exceed (level+delay) [r/min], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the speed command keeps below (level-delay) [r/min] and such state in the delay time, it will return to 1 <sup>st</sup> gain.
5	Large position deviation	In the previous 1 <sup>st</sup> gain, if the absolute value of the position deviation exceed (level+delay) [pulse], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the position deviation keeps below (level-delay) [pulse] and such state in the delay time, it will return to 1 <sup>st</sup> gain. <b>Note:</b> The unit of level and lag [pulse] acts as encoder resolution unit during position control and as linear encoder resolution unit during

		fully-closed loop control.
6	With position command	In the previous 1 <sup>st</sup> gain, if the position command is not 0, it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the 0 position command lasts in the delay time, it will return to 1 <sup>st</sup> gain.
7	Positioning not finished	In the previous 1 <sup>st</sup> gain, if the positioning is not finished, it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the state of positioning finished lasts in the delay time, it will return to 1 <sup>st</sup> gain.
8	Large actual speed	In the previous 1 <sup>st</sup> gain, if the absolute value of the actual speed exceed (level+delay) [r/min], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the actual speed keeps below (level-delay) [r/min] and such state in the delay time, it will return to 1 <sup>st</sup> gain.
9	With position command+ actual speed	In the previous 1 <sup>st</sup> gain, if the position command is not 0, it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the 0 position command lasts in the delay time and the absolute value of actual speed is below (level-delay) [r/min], it will return to 1 <sup>st</sup> gain.

P2.22	Data size	16bit	Data format	DEC
	Modbus address	1444, 1445	CANopen address	0x2216, 0x00

P2.23	Delay time of position control switching	Setting range	Default	Unit	Available mode		
		0–10000	0	ms	P		

In the position control, if set P2.22 to 3–9, when switching from 2<sup>nd</sup> gain to 1<sup>st</sup> gain, it is the time from meeting the trigger conditions to the actual switching.

P2.23	Data size	16bit	Data format	DEC
	Modbus address	1446, 1447	CANopen address	0x2217, 0x00

P2.24	Switching level of position control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode	P		

In the position control, if set P2.22 to 3–5, 8, 9, it is necessary to set triggering condition of gain switching. The unit will vary with the switching mode and setting.

**Note:** Please set the level  $\geq$  the delay

P2.24	Data size	16bit	Data format	DEC
	Modbus address	1448, 1449	CANopen address	0x2218, 0x00

P2.25	Switching delay of position control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode	P		

In the position control, if set P2.22 to 3–5, 8, 9, it is necessary to set switching conditions. The unit will vary with the switching mode and setting.

<b>Note:</b> Set the level<the delay, in the actual internal application, the delay=the level				
P2.25	Data size	16bit	Data format	DEC
	Modbus address	1450, 1451	CANopen address	0x2219, 0x00

P2.26	Switching time of position gain	Setting range	Default	Unit	Available mode		
		0–10000	0	ms	P		

In position control, if the offset between P2.00 and P2.04 is large, setting this parameter can control the torque changing and vibration caused by increasing gain during switching from small gain to large gain. The parameter is invalid when the position gain is switched from a large value to a smaller one.

P2.26	Data size	16bit	Data format	DEC
	Modbus address	1452, 1453	CANopen address	0x221A, 0x00

P2.27	Switching mode of speed control	Setting range	Default	Unit	Available mode		
		0–5	0	-		S	

The trigger conditions of gain switching during speed control are as below:

Setting value	Switching condition	Gain condition
[0]	1 <sup>st</sup> gain fixed	Be fixed in 1 <sup>st</sup> gain [P2.00–P2.04]
1	2 <sup>nd</sup> gain fixed	Be fixed in 2 <sup>nd</sup> gain [P2.05, P2.06, P2.08, P2.09]
2	Switching input with gain	Invalid: 1 <sup>st</sup> gain Valid: 2 <sup>nd</sup> gain
3	Torque command	In the previous 1 <sup>st</sup> gain, if the absolute value of the torque command exceed (level+delay) [0.1%], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the torque command keeps below (level-delay)[0.1%] in the delay time, it will return to 1 <sup>st</sup> gain.
4	Speed command variable	In previous 1 <sup>st</sup> gain, if the absolute value of speed command variable exceed (level+delay) [10r/min/s], it will switch to 2 <sup>nd</sup> gain In the previous 2 <sup>nd</sup> gain, if the absolute value of the speed command variable keeps below (level-delay) [10r/min/s] in the delay time, it will return to 1 <sup>st</sup> gain.
5	Speed command	In the previous 1 <sup>st</sup> gain, if the absolute value of the speed command exceed (level+delay) [r/min/s], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the speed command keeps below (level-delay) [r/min/s] and in the delay time, it will return to 1 <sup>st</sup> gain.

**Note:** The parameter is invalid for the position gain. The actual position gain is always 1st gain.

P2.27	Data size	16bit	Data format	DEC
	Modbus address	1454, 1455	CANopen address	0x221B, 0x00

P2.28	Delay time of speed control switching	Setting range	Default	Unit	Available mode		
		0–10000	0	ms		S	
In the speed control, if set P2.27 to 3–5, when switching from 2 <sup>nd</sup> gain to 1 <sup>st</sup> gain, it is the time from meeting the trigger conditions to the actual switching.							
P2.28	Data size	16bit	Data format		DEC		
	Modbus address	1456, 1457	CANopen address		0x221C, 0x00		

P2.29	Switching level of speed control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode		S	
In the speed control, if set P2.27 to 3–5, it is necessary to set triggering condition of gain switching. The unit will vary with the switching mode and setting.							
<b>Note:</b> Please set the level $\geq$ the delay.							
P2.29	Data size	16bit	Data format		DEC		
	Modbus address	1458, 1459	CANopen address		0x221D, 0x00		

P2.30	Switching delay of speed control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode		S	
In the speed control, if set P2.27 to 3–5, it is necessary to set switching conditions. The unit will be vary with the mode and setting.							
<b>Note:</b> Please set the level < the delay, in the actual application, the delay = the level.							
P2.30	Data size	16bit	Data format		DEC		
	Modbus address	1460, 1461	CANopen address		0x221E, 0x00		

P2.31	Switching mode of torque control	Setting range	Default	Unit	Available mode		
		0–3	0	-			T

The trigger conditions of gain switching during torque control are as below:

Setting value	Switching condition	Gain condition
[0]	1 <sup>st</sup> gain fixed	Be fixed in 1 <sup>st</sup> gain [P2.00–P2.04]
1	2 <sup>nd</sup> gain fixed	Be fixed in 2 <sup>nd</sup> gain [P2.05–P2.09]
2	Switching input with gain	Invalid: 1 <sup>st</sup> gain Valid: 2 <sup>nd</sup> gain
3	Torque command	In the previous 1 <sup>st</sup> gain, if the absolute value of the torque command exceed (level+delay)[0.1%], it will switch to 2 <sup>nd</sup> gain. In the previous 2 <sup>nd</sup> gain, if the absolute value of the torque command keeps below (level-delay) and such state in the delay time, it will return to 1 <sup>st</sup> gain.

**Note:** The parameter is invalid for the position gain. The actual position gain is 1<sup>st</sup> gain.

P2.31	Data size	16bit	Data format		DEC		
	Modbus address	1462, 1463	CANopen address		0x221F, 0x00		

P2.32	Delay time of torque control switching	Setting range	Default	Unit	Available mode		
		0–10000	0	ms			T
In torque control, if set P2.31 to 3, when switching from 2 <sup>nd</sup> gain to 1 <sup>st</sup> gain, it is the time from meeting the trigger conditions to the actual switching.							
P2.32	Data size	16bit	Data format		DEC		
	Modbus address	1464, 1465	CANopen address		0x2220, 0x00		

P2.33	Switching level of torque control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode			T
In the torque control, if set P2.31 to 3, it is necessary to set trigger condition of gain switching. The unit will vary with the mode and setting.							
<b>Note:</b> Please set the level ≥ the delay							
P2.33	Data size	16bit	Data format		DEC		
	Modbus address	1466, 1467	CANopen address		0x2221, 0x00		

P2.34	Switching delay of torque control	Setting range	Default	Unit	Available mode		
		0–20000	0	Based on mode			T
In the torque control, if set P2.31 to 3, it is necessary to set switching conditions. The unit will vary with the switching mode and setting.							
<b>Note:</b> Please set the level<the delay, in the actual application, the delay=the level							
P2.34	Data size	16bit	Data format		DEC		
	Modbus address	1468, 1469	CANopen address		0x2222, 0x00		

**6.3.3 Special motor control**

P2.41 <sup>2</sup>	Disturbances observer valid	Setting range	Default	Unit	Available mode		
		0–2	0	-	P	S	T
Set whether the disturbance observer is valid or not via this parameter.							
		Setting value	Function				
		[0]	Invalid				
		1	Disturbance observation				
		2	Disturbance compensation				
P2.41 <sup>2</sup>	Data size	16bit	Data format		DEC		
	Modbus address	1482, 1483	CANopen address		0x2229, 0x00		

P2.42	Disturbance observer compensation gain	Setting range	Default	Unit	Available mode		
		0–100	0.0	%	P	S	
This parameter is used to set the compensation gain of disturbance torque. Increasing the gain may improve the effect of suppressing disturbance impact but the noise may enhanced; it is necessary to use with P2.43 to find the best setting point. After setting P2.43, please increase the set value of P2.42.							
P2.42	Data size	16bit	Data format		DEC		
	Modbus address	1484, 1485	CANopen address		0x222A, 0x00		

P2.43	Disturbance observer cut-off frequency	Setting range	Default	Unit	Available mode		
		0-3000	200	Hz	P	S	
This parameter is used to set the cut-off frequency of disturbance observer. Decreasing the set value can downgrade the noise; while increase the set value can reduce the delay of disturbance torque compensation, it is necessary to be used in combination with P2.42.							
P2.43	Data size	16bit	Data format	DEC			
	Modbus address	1486, 1487	CANopen address	0x222B, 0x00			

P2.44	Torque command offset	Setting range	Default	Unit	Available mode		
		-500.0-500.0	0.0	%	P	S	T
This parameter is used to set the changing load compensation which is added to the torque command. It is usually be used in the vertical shaft application and other control modes except for the torque control mode.							
P2.44	Data size	16bit	Data format	DEC			
	Modbus address	1488, 1489	CANopen address	0x222C, 0x00			

P2.50 <sup>2</sup>	Fully-loop vibration suppressor valid	Setting range	Default	Unit	Available mode		
		0-2	0	-			
Set whether the speed detector is valid by this parameter							
		Setting value	Function				
		[0]	Invalid				
		1	Disturbance observation				
		2	Disturbance compensation				
P2.50 <sup>2</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1500, 1501	CANopen address	0x2232, 0x00			

P2.51	Fully-loop vibration suppressor cut-off frequency	Setting range	Default	Unit	Available mode		
		1.0-500.0	100.0	Hz			
This parameter is used to set the cut-off frequency of fully-closed-loop vibration suppressor.							
P2.51	Data size	16bit	Data format	DEC			
	Modbus address	1502, 1503	CANopen address	0x2233, 0x00			

P2.52	Fully-loop vibration suppressor compensation gain	Setting range	Default	Unit	Available mode		
		0-1000	0	%			
This parameter is used to set the compensation gain of fully-closed-loop vibration suppressor.							
P2.52	Data size	16bit	Data format	DEC			
	Modbus address	1504, 1505	CANopen address	0x2234, 0x00			

P2.53	Medium frequency vibration control switch	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T

Determine whether the medium frequency vibration control is valid by setting this parameter.						
		Set value	Role			
		[0]	Invalid			
		1	Valid			
P2.53	Data size	16bit	Data format	DEC		
	Modbus address	1506, 1507	CANopen address	0x2235, 0x00		
P2.54	Medium frequency vibration control frequency	Setting range	Default	Unit	Available mode	
		1–2000	100	Hz	P	S
Set the frequency for medium frequency vibration control.						
P2.54	Data size	16bit	Data format	DEC		
	Modbus address	1508, 1509	CANopen address	0x2236, 0x00		
P2.55	Fine tuning of medium frequency vibration control inertia	Setting range	Default	Unit	Available mode	
		1–1000	100	%	P	S
Set the fine tuning of medium frequency vibration control inertia. There will be no fine tuning when it is set the 100% (default).						
16bit	Data format	16bit	Data format	DEC		
	Modbus address	1510, 1511	CANopen address	0x2237, 0x00		
P2.56	Gain of medium frequency vibration control attenuation	Setting range	Default	Unit	Available mode	
		0–1000	0	%	P	S
Set the gain of medium frequency vibration control attenuation. When it is set to 0 (default), there is no attenuation effect. Users can adjust based on actual commissioning results. When it is set to 100%, Under ideal condition, the medium frequency vibration will be suppressed totally.						
P2.56	Data size	16bit	Data format	DEC		
	Modbus address	1512, 1513	CANopen address	0x2238, 0x00		
P2.57	Fine tuning of medium frequency vibration control filter time 1	Setting range	Default	Unit	Available mode	
		-10.00–10.00	0.00	ms	P	S
Set the fine tuning of medium frequency vibration control filter time 1, which can be calculated automatically based on P2.54 [medium frequency vibration control frequency]. Users can carry out fine tuning via this parameter.						
P2.57	Data size	16bit	Data format	DEC		
	Modbus address	1514, 1515	CANopen address	0x2239, 0x00		
P2.58	Fine tuning of medium frequency vibration control filter time 2	Setting range	Default	Unit	Available mode	
		-10.00–10.00	0.00	ms	P	S

Set the fine tuning of medium frequency vibration control filter time 2, which can be calculated automatically based on P2.54 [medium frequency vibration control frequency]. Users can carry out fine tuning via this parameter.

P2.58	Data size	16bit	Data format	DEC
	Modbus address	1516, 1517	CANopen address	0x223A, 0x00

P2.60 <sup>2</sup>	Speed observer valid	Setting range	Default	Unit	Available mode		
		0–2	0	-	P	S	T

Set whether speed observer is valid via this parameter.

Setting value	Function
[0]	Invalid
1	Speed observation
2	Speed compensation

P2.60 <sup>2</sup>	Data size	16bit	Data format	DEC
	Modbus address	1520, 1521	CANopen address	0x223C, 0x00

P2.61	Speed observer gain	Setting range	Default	Unit	Available mode		
		1–1000	100	Hz	P	S	T

This parameter is used to set the gain of the speed observer. Increasing the setting value may increase the response speed of the actual speed, but the vibration and noise may be raised too.

P2.61	Data size	16bit	Data format	DEC
	Modbus address	1522, 1523	CANopen address	0x223D, 0x00

P2.70	Friction compensation max-speed	Setting range	Default	Unit	Available mode		
		0–1000	20	r/min	P	S	

This parameter is used to set the max-speed of friction compensation.

P2.70	Data size	16bit	Data format	DEC
	Modbus address	1540, 1541	CANopen address	0x2246, 0x00

P2.71	Positive torque coefficient of friction compensation	Setting range	Default	Unit	Available mode		
		0.0–100.0	0.0	%/(10 r/min)	P	S	

Set the friction compensation value added to torque command when receiving the forward position command or speed command.

P2.71	Data size	16bit	Data format	DEC
	Modbus address	1542, 1543	CANopen address	0x2247, 0x00

P2.72	Negative torque coefficient of friction compensation	Setting range	Default	Unit	Available mode		
		-100.0–0.0	0.0	%/(10 r/min)	P	S	

Set friction compensation value added to the torque command when receiving negative position command or speed command.

P2.72	Data size	16bit	Data format	DEC
	Modbus address	1544, 1545	CANopen address	0x2248, 0x00

P2.73	Friction compensation valid	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	
Set whether friction compensation is valid by this parameter							
		Setting value	Function				
		[0]	Invalid				
		1	Friction compensation				
P2.73	Data size	16bit	Data format	DEC			
	Modbus address	1546, 1547	CANopen address	0x2249, 0x00			
P2.74	Automatic mode switch	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
Set whether automatic mode is valid via this parameter.							
		Set value	Role				
		[0]	Invalid				
		1	Valid				
P2.74	Data size	16bit	Data format	DEC			
	Modbus address	1548, 1549	CANopen address	0x224A, 0x00			
P2.75	Automatic mode gain	Setting range	Default	Unit	Available mode		
		0.0-3276.7	40.0	-	P	S	T
Set the gain of automatic mode via this parameter.							
P2.75	Data size	16bit	Data format	DEC			
	Modbus address	1550, 1551	CANopen address	0x224B, 0x00			
P2.76	Fine tuning of automatic mode inertia	Setting range	Default	Unit	Available mode		
		0-1000	100	%	P	S	T
Set the fine tuning of automatic mode inertia via this parameter.							
P2.76	Data size	16bit	Data format	DEC			
	Modbus address	1552, 1553	CANopen address	0x224C, 0x00			
P2.77	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T
It is forbidden to modify this parameter.							
P2.77	Data size	16bit	Data format	DEC			
	Modbus address	1554, 1555	CANopen address	0x224D, 0x00			
P2.78	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T
It is forbidden to modify this parameter.							

P2.78	Data size	16bit	Data format	DEC
	Modbus address	1556, 1557	CANopen address	0x224E, 0x00

P2.79	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.79	Data size	16bit	Data format	DEC
	Modbus address	1558, 1559	CANopen address	0x224F, 0x00

P2.80	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.80	Data size	16bit	Data format	DEC
	Modbus address	1560, 1561	CANopen address	0x2250, 0x00

P2.81	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.81	Data size	32bit	Data format	DEC
	Modbus address	1562, 1563	CANopen address	0x2251, 0x00

P2.82	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.82	Data size	32bit	Data format	DEC
	Modbus address	1564, 1565	CANopen address	0x2252, 0x00

P2.83	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.83	Data size	32bit	Data format	DEC
	Modbus address	1566, 1567	CANopen address	0x2253, 0x00

P2.84	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P2.84	Data size	32bit	Data format	DEC
	Modbus address	1568, 1569	CANopen address	0x2254, 0x00

2.85	Torque feedforward selection	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T

This parameter is used to set the torque feedforward selection.						
		Set value	Role			
		[0]	Speed command feedforward			
		1	Position command feedforward			
P2.85	Data size	16bit	Data format	DEC		
	Modbus address	1570, 1571	CANopen address	0x2255, 0x00		
P2.86	Field weakening control switch	Setting range	Default	Unit	Available mode	
		0-3	0	-	P	S
This parameter is used to control the field weakening and its mode.						
		Set value	Role			
		[0]	Invalid			
		1	Open-loop field weakening			
		2	Closed-loop field weakening			
		3	Closed-loop field weakening with feedforward			
P2.86	Data size	16bit	Data format	DEC		
	Modbus address	1572, 1573	CANopen address	0x2256, 0x00		
P2.87	Voltage utilization rate of field weakening control	Setting range	Default	Unit	Available mode	
		1-99	90	%	P	S
This parameter is used to set the voltage utilization rate of field weakening control.						
P2.87	Data size	16bit	Data format	DEC		
	Modbus address	1574, 1575	CANopen address	0x2257, 0x00		
P2.88	Bandwidth of open-loop field weakening	Setting range	Default	Unit	Available mode	
		1-500	50	%	P	S
This parameter is used to set the width of open-loop field weakening.						
P2.88	Data size	16bit	Data format	DEC		
	Modbus address	1576, 1577	CANopen address	0x2258, 0x00		
P2.89	Bandwidth of closed-loop field weakening	Setting range	Default	Unit	Available mode	
		1-100	20	%	P	S
This parameter is used to set the width of closed-loop field weakening.						
P2.89	Data size	16bit	Data format	DEC		
	Modbus address	1578, 1579	CANopen address	0x2259, 0x00		
P2.90	Max. field weakening current limit of closed-loop field weakening	Setting range	Default	Unit	Available mode	
		1-100	90	%	P	S
This parameter is used to set the max. field weakening current limit of closed-loop field weakening.						

P2.90	Data size	16bit	Data format	DEC
	Modbus address	1580, 1581	CANopen address	0x225A, 0x00

## 6.4 I/O management parameters (P3)

### 6.4.1 Digital input/output

P3.00 <sup>1</sup>	Input configuration of digital input 1	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x003	-	P	S	T

This parameter is used to select the configuration of the digital value 1 input function. It is a hex number.

0x \* —: \* means the valid mode: 0: optical coupler conduction valid; 1: optical coupler non-conduction valid.

0x— \* \* : \* \* means the selected function, the detailed information is as below:

Signal name	Sign	Setting value		Available mode		
		Optical coupler non-conduction valid	Optical coupler conduction valid			
Invalid	—	0x100	0x000	P	S	T
Positive direction drive disabled	POT	0x101	0x001	P	S	T
Negative direction drive disabled	NOT	0x102	0x002	P	S	T
Servo enabling	SON	0x103	0x003	P	S	T
Alarm clearing	CLA	0x104	0x004	P	S	T
Control mode switching	MCH	0x105	0x005	P	S	T
Gain switching	PLC	0x106	0x006	P	S	T
Retention pulse clearing	RPC	0x107	0x007	P		
Command pulse disabled	PLL	0x108	0x008	P		
Torque limit switching	TLC	0x109	0x009	P	S	
Internal speed command 1	SPD1	0x10A	0x00A		S	T
Internal speed command 2	SPD2	0x10B	0x00B		S	T
Internal speed command 3	SPD3	0x10C	0x00C		S	
Zero speed clamp	ZRS	0x10D	0x00D		S	T
Speed command sign	S-SIGN	0x10E	0x00E		S	
Torque command sign	T-SIGN	0x10F	0x00F			T
Internal position command 1	POS1	0x110	0x010	P		
Internal position command 2	POS2	0x111	0x011	P		
Internal position command 3	POS3	0x112	0x012	P		
Internal position command 4	POS4	0x113	0x013	P		
External fault	EXT	0x114	0x014	P	S	T
Inertia ratio switching	JC	0x115	0x015	P	S	T
Emergency stop	EMG	0x116	0x016	P	S	T
HOME switch input	HOME	0x117	0x017	P		
HOME trigger	HTRG	0x118	0x018	P		
Molecule 1 of electronic gear ratio	SC1	0x119	0x019	P		

Molecule 2 of electronic gear ratio	SC2	0x11A	0x01A	P		
PTP control trigger	TRIG	0x11B	0x01B	P		
Vibration control switching input	VS-SEL	0x11C	0x01C	P		
Fast stop	Q-STOP	0x11D	0x01D	P	S	T
PTP control stop	PTP-ST	0x11E	0x01E	P		
Absolute position clearing	PCLR	0x11F	0x01F	P		
Internal position command 5	POS5	0x120	0x020	P		
Internal position command 6	POS6	0x121	0x021	P		
Internal position command 7	POS7	0x122	0x022	P		
Forward jogging	FJOG	0x123	0x023	P		
Reverse jogging	RJOG	0x124	0x024	P		
High/low speed switching of jogging	JOGC	0x125	0x025	P		
(Reserved)	/	0x126	0x026			
(Reserved)	/	0x127	0x027			
(Reserved)	/	0x128	0x028			
(Reserved)	/	0x129	0x029			
(Reserved)	/	0x12A	0x02A			
Terminal JOG enabling	DJOG	0x12C	0x02C	P		
Gantry synchronization input clear	GIN	0x12D	0x02D	P		
Master gantry synchronization alignment sensor	GSM	0x12E	0x02E	P		
Slave gantry synchronization alignment sensor	GSS	0x12F	0x02F	P		
Dynamic braking relay feedback	DBS	0x130	0x030	P	S	T
Manual and automatic switching of turret	DAT	0x131	0x031	P		
Forward jogging of turret	DFJ	0x132	0x032	P		
Reverse jogging of turret	DRJ	0x133	0x033	P		
Switching between fully-closed loop and semi-closed loop	FCS	0x134	0x034	P		
PTP terminal pause	PSTOP	0x135	0x035	P		
EzJOG terminal pause	ESTOP	0x136	0x036	P		

**Note:** The default value is the function selection corresponding to the position mode.

P3.00 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1600, 1601	CANopen address	0x2300, 0x00

P3.01 <sup>1</sup>	Input configuration of digital 2	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x00D	-	P	S	T
P3.02 <sup>1</sup>	Input configuration of digital 3	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x004	-	P	S	T
P3.03 <sup>1</sup>	Input configuration of digital 4	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x016	-	P	S	T
P3.04 <sup>1</sup>	Input configuration of digital 5	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x019	-	P	S	T
P3.05 <sup>1</sup>	Input configuration of digital 6	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x01A	-	P	S	T
P3.06 <sup>1</sup>	Input configuration of digital 7	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x001	-	P	S	T
P3.07 <sup>1</sup>	Input configuration of digital 8	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x002	-	P	S	T
P3.08 <sup>1</sup>	Input configuration of digital 9	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x007	-	P	S	T
P3.09 <sup>1</sup>	Input configuration of digital 10	Setting range	Default	Unit	Available mode		
		0x000–0x136	0x008	-	P	S	T

These parameters are used to set the input function of digital value 2–10, and they are hex numbers.

The setting method is the same as P3.00.

**Note:** The default value is the function selection corresponds to position mode.

P3.01 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1602, 1603	CANopen address	0x2301, 0x00
P3.02 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1604, 1605	CANopen address	0x2302, 0x00
P3.03 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1606, 1607	CANopen address	0x2303, 0x00
P3.04 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1608, 1609	CANopen address	0x2304, 0x00
P3.05 <sup>1</sup>	Data size	16bit	Data format	HEX

	Modbus address	1612, 1613	CANopen address	0x2306, 0x00
P3.07 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1614, 1615	CANopen address	0x2307, 0x00
P3.08 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1616, 1617	CANopen address	0x2308, 0x00
P3.09 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1618, 1619	CANopen address	0x2309, 0x00

P3.10 <sup>1</sup>	Output configuration of digital 1	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x001	-	P	S	T

This parameter is used to select the configuration of the digital value 1 output function. It is a hex number.

0x \* —: \* means valid mode: 0: optical coupler conduction valid; 1: optical coupler non-conduction valid

0x— \* \*: \* \* means the selected function, the detailed information is as below:

Signal name	Sign	Setting value		Available mode		
		Optical coupler non-conduction valid	Optical coupler conduction valid			
Invalid	—	0x100	0x000	P	S	T
Servo ready output	RDY	0x101	0x001	P	S	T
Servo operation output	RUN	0x102	0x002	P	S	T
Fault output	ALM	0x103	0x003	P	S	T
Reserved	/	0x104	0x004			
Electromagnetic brake release signal	BRK	0x105	0x005	P	S	T
Position command or not	PCMD	0x106	0x006	P		
Positioning finished	PLR	0x107	0x007	P		
Switching state of control mode	MCHS	0x108	0x008	P	S	T

<b>Note:</b> The default value is the function selection corresponds to position mode.				
P3.10 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1620, 1621	CANopen address	0x230A, 0x00

P3.11 <sup>1</sup>	Output configuration of digital 2	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x003	-	P	S	T
P3.12 <sup>1</sup>	Output configuration of digital 3	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x007	-	P	S	T
P3.13 <sup>1</sup>	Output configuration of digital 4	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x00D	-	P	S	T
P3.14 <sup>1</sup>	Output configuration of digital 5	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x005	-	P	S	T
P3.15 <sup>1</sup>	Output configuration of digital 6	Setting range	Default	Unit	Available mode		
		0x000–0x11F	0x00E	-	P	S	T

These parameters are used to set the output function of digital value 2–6, and they are hex numbers.

The setting method is the same as P3.10.

**Note:** The default value is the function selection corresponds to position mode.

P3.11 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1622, 1623	CANopen address	0x230B, 0x00
P3.12 <sup>1</sup>	Data size	16bit	Data format	HEX

P3.15 <sup>1</sup>	Data size	16bit	Data format	HEX
	Modbus address	1630, 1631	CANopen address	0x230F, 0x00

P3.16	Function configuration of DI capture encoder	Setting range	Default	Unit	Available mode		
		0–778	0	-	P	S	T

DI port capture function configuration, capture the encoder position via the jump edge of DI port in real time, check encoder value captured via R1.16.

Data bit	Setup instruction	Remark
bit0–3	bit0–3=0x1–0xA, corresponds to capture port DI1–DI10	Others are invalid state
bit8–9	bit8=1, bit9=0, capture only on DI port falling edge;	
	bit8=0, bit9=1, capture only on DI port rising edge; bit8=1, bit9=1, capture on both DI port rising edge and falling edge.	

P3.16	Data size	16bit	Data format	DEC
	Modbus address	1632, 1633	CANopen address	0x2310, 0x00

6.4.2 Analog input / output adjustment

P3.20	Offset of analog input 1	Setting range	Default	Unit	Available mode		
		-10.000~10.000	0.000	V	P	S	T

This parameter can be used to adjust the analog input 1 to improve the effective accuracy of the analog input.

Due to zero drift of the AI devices or induced voltage of ambient environment and other reasons, the actual corresponding quantity of AI may deviate from the expected value, and such deviation can be eliminated by setting the offset of AI.

The meaning of the analog offset voltage is shown in below figure:

For example, after analog input 1 command terminal of the drive is connected with analog reference signal, then even if the analog reference signal is 0, the voltage value of analog input 1 (R1.05) displayed by the panel will be 0.02V, P3.20 should be set to 0.02 at this time. The drive will automatically subtract 0.02V from the analog input value received. If the analog input 2 voltage displayed by the panel is -0.02V, then parameter P3.20 should be set to -0.02. The drive will automatically add 0.02V to the analog input value received and the value displayed by the panel will change at the same time.

P3.20	Data size	32bit	Data format	DEC
	Modbus address	1640, 1641	CANopen address	0x2314, 0x00

P3.21	Filter of analog input 1	Setting range	Default	Unit	Available mode		
		0.0~1000.0	1.0	ms	P	S	T

This parameter is used to set the time constant of the first order low-pass filter corresponds to analog input 1. Setting this parameter can smooth the command changing when the analog input changes violently. Please refer to the figure below:

P3.21	Data size	16bit	Data format	DEC
	Modbus address	1642, 1643	CANopen address	0x2315, 0x00

P3.22	Voltage protection of analog input 1	Setting range	Default	Unit	Available mode		
		0.000–10.000	0.000	V	P	S	T

This parameter is used to set the overvoltage protection of analog input 1.  
 If the absolute value of R1.05 exceeds the setting value, the system will report fault.

**Note:**

1. The default value 0 means no overvoltage protection;
2. The input voltage should be no more than 10V, otherwise damage may occur to the drive.

P3.22	Data size	32bit	Data format	DEC
	Modbus address	1644, 1645	CANopen address	0x2316, 0x00

P3.23	Offset of analog input 2	Setting range	Default	Unit	Available mode		
		-10.000–10.000	0.000	V	P	S	T

This parameter can be used to adjust the analog input 2 to improve the effective accuracy of analog input.

The setting method is the same with P3.20.

P3.23	Data size	32bit	Data format	DEC
	Modbus address	1646, 1647	CANopen address	0x2317, 0x00

P3.24	Filter of analog input 2	Setting range	Default	Unit	Available mode		
		0.0–1000.0	1.0	ms	P	S	T

This parameter is used to set the time constant of the first order low-pass filter corresponds to the command. Setting this parameter can smooth the changing of actual output command when the command changes violently. Please refer to the figure below:

P3.24	Data size	16bit	Data format	DEC
	Modbus address	1648, 1649	CANopen address	0x2318, 0x00

P3.25	Voltage protection of analog input 2	Setting range	Default	Unit	Available mode		
		0.000–10.000	0.000	V	P	S	T

This parameter is used to set the overvoltage protection value of analog input 2.

**Note:**

1. The default value 0 means no overvoltage protection;				
2. The input voltage should be no more than 10V, otherwise damage may occur to the drive.				
P3.25	Data size	32bit	Data format	DEC
	Modbus address	1650, 1651	CANopen address	0x2319, 0x00

P3.26 <sup>1</sup>	Function selection of analog input 1	Setting range	Default	Unit	Available mode		
		0–7	0	-	P	S	T
P3.27 <sup>1</sup>	Function selection of analog input 2	Setting range	Default	Unit	Available mode		
		0–7	3	-	P	S	T

Select the analog input channel function via this parameter

Setting value	Definition	Unit
[0]	Invalid	-
1	Speed limit	r/min
2	Forward torque limit	0.1%
3	Speed command	r/min
4	Torque command	0.1%
5	Speed compensation	r/min
6	Torque compensation	0.1%
7	Negative torque limit	0.1%

P3.26 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1652, 1653	CANopen address	0x231A, 0x00
P3.27 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1654, 1655	CANopen address	0x231B, 0x00

P3.28	Analog speed compensation gain	Setting range	Default	Unit	Available mode		
		0.0–100.0	0.0	%	P		

Set the analog speed compensation gain via this parameter.

P3.28	Data size	16bit	Data format	DEC
	Modbus address	1656, 1657	CANopen address	0x231C, 0x00

P3.29	Analog torque compensation gain	Setting range	Default	Unit	Available mode		
		0.0–100.0	0.0	%	P	S	T

Set the analog torque compensation gain via this parameter.

P3.29	Data size	16bit	Data format	DEC
	Modbus address	1658, 1659	CANopen address	0x231D, 0x00

P3.30 <sup>1</sup>	Analog output 1 function selection	Setting range	Default	Unit	Available mode		
		0–19	0	-	P	S	T
P3.32 <sup>1</sup>	Analog output 2 function selection	Setting range	Default	Unit	Available mode		
		0–19	0	-	P	S	T

This group of parameters is used to select the monitoring parameters to be outputted in analog

form.

Setting value	Definition	Unit
[0]	Invalid	-
1	Motor speed	r/min
2	Speed of position command	r/min
3	Internal position command	pulse(Encoder unit)
4	Speed command	r/min
5	Torque command	0.1%
6	Torque feedback	0.1%
7	Command position deviation	reference unit
8	Encoder position deviation	pulse(Encoder unit)
9	Fully-closed loop position deviation	pulse(Linear encoder unit)
10	Hybrid control deviation	reference unit
11	DC voltage of main circuit	V
12	Positive torque limit	0.1%
13	Negative torque limit	0.1%
14	Speed limit value	r/min
15	Inertia ratio	%
16	Analog input 1*	V
17	Analog input 2*	V
18	Analog input 3*	V
19	Drive temperature	℃

**Note:** When P3.31 and P3.33 are set to 1000, analog input 1, analog input 2 and analog input 3 can output the voltage value inputted from the analog input terminals at any time.

P3.30 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1660, 1661	CANopen address	0x231E, 0x00
P3.32 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1664, 1665	CANopen address	0x2320, 0x00

P3.31	Voltage gain of analog output 1	Setting range	Default	Unit	Available mode		
		1-214748364	1	[P3.30 unit]/V	P	S	T
P3.33	Voltage gain of analog output 2	Setting range	Default	Unit	Available mode		
		1-214748364	1	[P3.32 unit]/V	P	S	T

These parameters are used to set the gain of analog output. The detailed unit is relative to P3.30 and P3.32.

**Example:** Suppose the actual speed is outputted from the AO1 terminal, 10V corresponds to a speed of 3000r/min and 0V corresponds to 0. Then set P3.30=1, P3.31=300, the relation between the actual speed reference and output voltage is shown as below:

**Note:**

1. If the actual output speed is more than 3000r/min, AO1 output is 10V. Please select the gain according to the actual range of the parameter.
2. When P3.30 and P3.32 select other functions, the gain setting is the same.

P3.31	Data size	32bit	Data format	DEC
	Modbus address	1662, 1663	CANopen address	0x231F, 0x00
P3.33	Data size	32bit	Data format	DEC
	Modbus address	1666, 1667	CANopen address	0x2321, 0x00

P3.34	Offset voltage of analog output 1	Setting range	Default	Unit	Available mode		
		-10.000~10.000	0.000	V	P	S	T
P3.35	Offset voltage of analog output 2	Setting range	Default	Unit	Available mode		
		-10.000~10.000	0.000	V	P	S	T

This parameter can be used to adjust the AO1 and AO2 to regulate the actual value of analog output voltage.

Actual value of analog output voltage = Original value of analog output voltage + Offset value of analog output voltage

P3.34	Data size	32bit	Data format	DEC
	Modbus address	1668, 1669	CANopen address	0x2322, 0x00
P3.35	Data size	32bit	Data format	DEC
	Modbus address	1670, 1671	CANopen address	0x2323, 0x00

P3.36 <sup>1</sup>	Analog output monitor setting	Setting range	Default	Unit	Available mode		
		0~2	0	-	P	S	T

This parameter is used to set the output mode and voltage range of the analog output.

Setting value	Output mode
[0]	Voltage output with sign(-10V~10V)
1	Absolute voltage output (0V~10V)
2	Voltage output with zero offset (0V~10V, 5V center)

P3.36 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1672, 1673	CANopen address	0x2324, 0x00

## 6.4.3 Digital input / output settings

P3.40 <sup>1</sup>	Travel limit switch shield	Setting range	Default	Unit	Available mode		
		0–2	1	-	P	S	T

This parameter is used to set whether the digital input configured as forward drive disabling (0x001 or 0x101) and reverse drive disabling (0x002 or 0x102) is valid or not. If the function of the travel limit switch needs to be shielded, this parameter can do the trick.

Setting value	Function
0	Travel limit switch is normal
[1]	Travel limit switch is disabled
2	Ultralimit fault

**Note:** When the travel limit switch is normal and the digital input configured as forward drive disabling is active, the motor will stop immediately and cannot continue to run forward, but it is able to receive the reverse running command.

P3.40 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1680, 1681	CANopen address	0x2328, 0x00

P3.41 <sup>1</sup>	Emergency stop switch shield	Setting range	Default	Unit	Available mode		
		0–1	1	-	P	S	T

This parameter is used to set whether digital input configured as EMG (0x016 or 0x116) is valid or not. If the function of the emergency stop switch needs to be shielded, this parameter can do the trick.

Setting value	Function
0	Emergency stop switch is normal
[1]	Emergency stop switch is disabled

If the digital input set as EMG is active, then Er10-4 will occur.

**Note:**

- If Er10-4 occurs, the servo drive will stop at the stopping mode set by P4.30.
- Clearance of Er10-4: Please ensure there is no danger, and then clear the alarm signal (disable the digital input configured as EMG). After clearing the alarm displayed, it is necessary to enable the servo drive again to operate the servo system.

P3.41 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1682, 1683	CANopen address	0x2329, 0x00

P3.43 <sup>1</sup>	Digital input filter	Setting range	Default	Unit	Available mode		
		1–800	1	0.125ms	P	S	T

This parameter is used to set the filter time of the digital input.

**Note:** The parameter works alone for 10 digital inputs.

P3.43 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1686, 1687	CANopen address	0x232B, 0x00

P3.44	Command pulse input invalid setting disabled	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
<p>This parameter can set whether the digital input configured as command pulse disabling (0x008 or x0108) among P3.00–P3.09 is valid or not. If command pulse disabling function needs to be blocked, this parameter will do the trick.</p> <p>0:Valid; 1:Invalid</p>							
P3.44	Data size	16bit	Data format	DEC			
	Modbus address	1688, 1689	CANopen address	0x232C, 0x00			

P3.45 <sup>1</sup>	Clearing mode of retention pulse	Setting range	Default	Unit	Available mode								
		0–1	1	-	P								
<p>This parameter is used to set valid mode of the digital input configured as RPC (0x007 or 0x107) among P3.00–P3.09.</p> <table border="1" style="margin-left: 40px;"> <thead> <tr> <th>Setting value</th> <th>Function</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ON level clear</td> </tr> <tr> <td>[1]</td> <td>Rising edge clear</td> </tr> </tbody> </table>								Setting value	Function	0	ON level clear	[1]	Rising edge clear
Setting value	Function												
0	ON level clear												
[1]	Rising edge clear												
P3.45 <sup>1</sup>	Data size	16bit	Data format	DEC									
	Modbus address	1690, 1691	CANopen address	0x232D, 0x00									

P3.50	Range of position arrival	Setting range	Default	Unit	Available mode		
		0–2 <sup>18</sup>	100	reference unit	P		
<p>This parameter is used to set the range of position arrival. When the deviation between the position feedback pulse and position command pulse is in this range, it indicates position arrival.</p>							
P3.50	Data size	32bit	Data format	DEC			
	Modbus address	1700, 1701	CANopen address	0x2332, 0x00			

P3.51	Output mode of position arrival	Setting range	Default	Unit	Available mode														
		0–4	0	-	P														
<p>This parameter can be used to set the condition for the position arrival output signal and the action mode after output.</p> <table border="1" style="margin-left: 40px;"> <thead> <tr> <th>Setting value</th> <th>Output mode</th> </tr> </thead> <tbody> <tr> <td>[0]</td> <td>Output is valid if the position deviation is within the range of P3.50.</td> </tr> <tr> <td>1</td> <td>Output is valid when there is no position command and the position deviation is within the range of P3.50.</td> </tr> <tr> <td>2</td> <td>Output is valid when when there is no position command, the zero speed detection signal is valid and position deviation is within the range of P3.50.</td> </tr> <tr> <td>3</td> <td>Output is valid when transiting from the position command to no position command and the position deviation is within the range of P3.50. And then, valid state of output continues until passing the time set by P3.52, after that, updates the position arrival output state according to the position command and the position deviation.</td> </tr> <tr> <td>4</td> <td>Output is valid when transiting from position command to no position command while position deviation is within P3.50. Thereafter, the valid state of output continues until passing the set time by P3.52.</td> </tr> </tbody> </table>								Setting value	Output mode	[0]	Output is valid if the position deviation is within the range of P3.50.	1	Output is valid when there is no position command and the position deviation is within the range of P3.50.	2	Output is valid when when there is no position command, the zero speed detection signal is valid and position deviation is within the range of P3.50.	3	Output is valid when transiting from the position command to no position command and the position deviation is within the range of P3.50. And then, valid state of output continues until passing the time set by P3.52, after that, updates the position arrival output state according to the position command and the position deviation.	4	Output is valid when transiting from position command to no position command while position deviation is within P3.50. Thereafter, the valid state of output continues until passing the set time by P3.52.
Setting value	Output mode																		
[0]	Output is valid if the position deviation is within the range of P3.50.																		
1	Output is valid when there is no position command and the position deviation is within the range of P3.50.																		
2	Output is valid when when there is no position command, the zero speed detection signal is valid and position deviation is within the range of P3.50.																		
3	Output is valid when transiting from the position command to no position command and the position deviation is within the range of P3.50. And then, valid state of output continues until passing the time set by P3.52, after that, updates the position arrival output state according to the position command and the position deviation.																		
4	Output is valid when transiting from position command to no position command while position deviation is within P3.50. Thereafter, the valid state of output continues until passing the set time by P3.52.																		

P3.51	Data size	16bit	Data format	DEC
	Modbus address	1702, 1703	CANopen address	0x2333, 0x00

P3.52	Hold time of position arrival output terminal	Setting range	Default	Unit	Available mode		
		0–30000	0	ms	P		

This parameter is used to set the hold time of position arrival output terminal.

Setting value	Action
[0]	Hold time is infinite, continuous valid state to the next position command position
1–30000	Valid only within the setting value [ms]. If position command is received during hold time, it will change to invalid state immediately.

P3.52	Data size	16bit	Data format	DEC
	Modbus address	1704, 1705	CANopen address	0x2334, 0x00

P3.53	Speed matching range	Setting range	Default	Unit	Available mode		
		10–20000	50	r/min	P	S	T

This parameter is used to set the detection condition of speed matching output.

If the difference between the speed command and the motor speed is below the setting value, then the output state of the speed matching is valid.

The threshold of the speed matching when there is 10r/min lag:

Speed matching output:

Invalid → Valid threshold:  $(P3.53 - 10)r/min$

Valid → The critical value of invalid:  $(P3.53 + 10) r/min$

P3.53	Data size	16bit	Data format	DEC
	Modbus address	1706, 1707	CANopen address	0x2335, 0x00

P3.54	Speed reaching range	Setting range	Default	Unit	Available mode		
		10–20000	1000	r/min	P	S	T

This parameter is used to set the detection condition for speed reaching output. If the transient motor speed exceeds the setting value, the output is valid. There is 10r/min lag in detection.

P3.54	Data size	16bit	Data format	DEC
	Modbus address	1708, 1709	CANopen address	0x2336, 0x00

P3.55	Zero speed range	Setting range	Default	Unit	Available mode		
		10–20000	50	r/min	P	S	T

This parameter is used to set the detection condition for speed zero output. When the absolute value of motor speed is within this range, it is deemed as zero speed and the zero speed output signal will become valid. There is 10r/min lag in detection.

P3.55	Data size	16bit	Data format	DEC
	Modbus address	1710, 1711	CANopen address	0x2337, 0x00

P3.56	Locked time of servo after braking	Setting range	Default	Unit	Available mode		
		0–1000	50	ms	P	S	T
This parameter is used to set the locked time of the servo after braking in the locked state. The servo is OFF in the locked state, the digital output state configured as BRK (0x005 or 0x105) is invalid. At this time, the servo will continue to be locked for a period of time so that the motor will not rotate during the action of the relay.							
P3.56	Data size	16bit	Data format	DEC			
	Modbus address	1712, 1713	CANopen address	0x2338, 0x00			

P3.57	Braking delay of electromagnetic brake	Setting range	Default	Unit	Available mode		
		0–30000	500	ms	P	S	T
This parameter is used to set the braking delay time of the electromagnetic brake. When the servo is OFF or alarm is reported in running state, it indicates the speed may be too fast, so it will delay for a period time before rendering the digital output signal configured as BRK (0x005 or 0x105) invalid. If the motor speed drops below the set value of P3.58 during the delay period, the output of BRK will be invalid in advance.							
P3.57	Data size	16bit	Data format	DEC			
	Modbus address	1714, 1715	CANopen address	0x2339, 0x00			

P3.58 <sup>1</sup>	Motor speed of brake release	Setting range	Default	Unit	Available mode		
		0–1000	30	r/min	P	S	T
This parameter is used to set the motor speed threshold value when the brake is released.							
P3.58 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1716, 1717	CANopen address	0x233A, 0x00			

P3.59	Torque reaching range	Setting range	Default	Unit	Available mode		
		5.0–300.0	50.0	%			T
This parameter is used to set the detection condition for torque reaching output. If the motor torque feedback exceeds this setting value, the output of TRCH (0x010 of 0x110) is valid. There is 5% lag in detection.							
P3.59	Data size	16bit	Data format	DEC			
	Modbus address	1718, 1719	CANopen address	0x233B, 0x00			

#### 6.4.4 Analog input 3 adjustment

P3.70 <sup>1</sup>	Analog input 3 function selection	Setting range	Default	Unit	Available mode		
		0–7	4	-	P	S	T
This parameter is used to set the function of analog input 3:							
		Setting value	Definition	Unit			
		0	Invalid	-			
		1	Speed limit	(r/min)			
		2	Forward torque limit *1	0.1%			

	3	Speed command *2	(r/min)
	[4]	Torque command	0.1%
	5	Speed compensation	(r/min)
	6	Torque compensation	0.1%
	7	Negative-direction torque limit	0.1%

**Note:**

\*1 If P3.70 is 2 and P0.09 is 0 or 4, the analog input 3 corresponds to the positive torque limit internally and P0.62–P0.65, P3.23–P3.25 correspond to the negative torque limit internally.

\*2 If P3.70 is 3, P0.42–P0.45, P3.20–P3.22 are invalid.

P3.70 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1740, 1741	CANopen address	0x2346, 0x00

P3.71	Zero offset of analog input 3	Setting range	Default	Unit	Available mode		
		-10.000–10.000	0.000	V	P	S	T

The zero offset voltage of analog input 3.

P3.71	Data size	32bit	Data format	DEC
	Modbus address	1742, 1743	CANopen address	0x2347, 0x00

P3.72	Dead zone of analog input 3	Setting range	Default	Unit	Available mode		
		0.000–3.000	0.000	V	P	S	T

Dead zone range of analog input 3.

P3.72	Data size	16bit	Data format	DEC
	Modbus address	1744, 1745	CANopen address	0x2348, 0x00

P3.73	Gain of analog input 3	Setting range	Default	Unit	Available mode		
		0–2000	300	[P3.70 unit]/V	P	S	T

This parameter is used to set the gain of analog input 3. The unit of the gain is related to the function of P3.70

P3.73	Data size	32bit	Data format	DEC
	Modbus address	1746, 1747	CANopen address	0x2349, 0x00

P3.74	Analog input 3 reverse	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter is used to set the voltage polarity of analog input 3.

Setting value	Detection result	
[0]	Positive polarity	[+voltage]→[positive value],[ - voltage]→[negative value]
1	Negative polarity	[+voltage]→[negative value],[ - voltage]→[positive value]

P3.74	Data size	16bit	Data format	DEC
	Modbus address	1748, 1749	CANopen address	0x234A, 0x00

P3.75	Voltage protection of analog input 3	Setting range	Default	Unit	Available mode		
		0.000–10.000	0.000	V	P	S	T

This parameter is used to set the overvoltage protection value of analog input 3.  
If the absolute value of analog input 3 voltage exceeds the set value, the system will report alarm.

P3.75	Data size	32bit	Data format	DEC
	Modbus address	1750, 1751	CANopen address	0x234B, 0x00

P3.76	Analog input 3 filter	Setting range	Default	Unit	Available mode		
		0.0–1000.0	0.0	ms	P	S	T

This parameter is used to set the time constant of first order low-pass filter of analog input 3.

P3.76	Data size	16bit	Data format	DEC
	Modbus address	1752, 1753	CANopen address	0x234C, 0x00

P3.77	Deadzone mode of analog input	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

Set the deadzone voltage mode of analog input by this parameter

Setting value	Definition
[0]	Normal mode
1	CNC mode. When AI is smaller than the deadzone, the valid value is 0: When AI is larger than the deadzone, the valid value is AI-deadzone.

P3.77	Data size	16bit	Data format	DEC
	Modbus address	1754, 1755	CANopen address	0x234D, 0x00

P3.90	Pulse input filter	Setting range	Default	Unit	Available mode		
		0–7	2	-	P	S	T

This parameter is used to set filter time of the pulse input.

Setting value	Width of pulse input
0	400kHz
1	500kHz
[2]	1MHz
3	2MHz
4	4MHz
5	No filter
6	200kHz
7	100kHz

P3.90	Data size	16bit	Data format	DEC
	Modbus address	1780, 1781	CANopen address	0x235A, 0x00

P3.91	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T

It is forbidden to modify this parameter.

P3.91	Data size	16bit	Data format	DEC
	Modbus address	1782, 1783	CANopen address	0x235B, 0x00

P3.92	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T
It is forbidden to modify this parameter.							
P3.92	Data size	16bit	Data format	DEC			
	Modbus address	1784, 1785	CANopen address	0x235C, 0x00			

## 6.5 Extension and application (P4)

### 6.5.1 Communication setting

P4.01 <sup>1</sup>	485 local communication address	Setting range	Default	Unit	Available mode		
		1–255	1	-	P	S	T
This parameter is used to set local (slave) communication address of 485 serial communication.							
P4.01 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1802, 1803	CANopen address	0x2401, 0x00			

P4.02 <sup>1</sup>	CAN communication baud rate	Setting range	Default	Unit	Available mode		
		0–5	1	-	P	S	T
This parameter is used to select CAN communication baud rate. Available baud rate are as follow:							
		Setting value	Baud rate				
		0	1000kbps				
		[1]	500kbps				
		2	250kbps				
		3	125kbps				
		4	50kbps				
		5	20kbps				
P4.02 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1804, 1805	CANopen address	0x2402, 0x00			

P4.03 <sup>1</sup>	485 communication baud rate	Setting range	Default	Unit	Available mode		
		0–3	1	-	P	S	T
This parameter is used to select 485 communication baud rate. Available baud rate are as follow:							
		Setting value	Baud rate				
		0	9600bps				
		[1]	19200bps				
		2	38400bps				
		3	57600bps				
P4.03 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1806, 1807	CANopen address	0x2403, 0x00			

P4.04 <sup>1</sup>	485 communication parity mode	Setting range	Default	Unit	Available mode		
		0-5	0	-	P	S	T
This parameter is used to set the 485 communication parity mode and it only supports RTU mode.							
		Setting value	Baud rate				
		[0]	None (N, 8, 1)				
		1	Even (E, 8, 1)				
		2	Odd (O, 8, 1)				
		3	None(N, 8, 2)				
		4	Even(E, 8, 2)				
		5	Odd(O, 8, 2)				
P4.04 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1808, 1809	CANopen address	0x2404, 0x00			
P4.05 <sup>1</sup>	CAN communication node	Setting range	Default	Unit	Available mode		
		1-127	1	-	P	S	T
This parameter is used to set the local (salve) CAN communication node no..							
P4.05 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1810, 1811	CANopen address	0x2405, 0x00			
P4.06	485 communication fault clearing mode	Setting range	Default	Unit	Available mode		
		0-1	1	-	P	S	T
Set the processing method of the drive during 485 communication fault.							
		Setting value	Meaning				
		0	Do not clear fault				
		[1]	Clear fault automatically				
P4.06	Data size	16bit	Data format	DEC			
	Modbus address	1812, 1813	CANopen address	0x2406, 0x00			
P4.07 <sup>1</sup>	EtherCAT synchronous cycle	Setting range	Default	Unit	Available mode		
		0-3	2	-	P	S	T
This parameter is used to the the synchronous interruption cycle of DC sync0 when DC mode is adopted for EtherCAT communication.							
		Setting value	Meaning				
		0	250us				
		1	500us				
		[2]	1ms				
		3	2ms				
P4.07 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1814, 1815	CANopen address	0x2407, 0x00			

P4.08 <sup>1</sup>	EtherCAT synchronous type	Setting range	Default	Unit	Available mode		
		0–2	0	-	P	S	T
Set the synchronous mode between master station and slave station of EtherCAT communication.							
		Setting value	Meaning				
		[0]	Free-run				
		2	DC mode(sync0)				
P4.08 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1816, 1817	CANopen address	0x2408, 0x00			

P4.09 <sup>1</sup>	EtherCAT fault detection time	Setting range	Default	Unit	Available mode		
		0–1000	100	ms	P	S	T
Set EtherCAT communication fault detection time.							
<b>Note:</b> When setting the parameter to 0, do not detect EtherCAT fault.							
P4.09 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1818, 1819	CANopen address	0x2409, 0x00			

### 6.5.2 Servo type and communication control command

P4.10 <sup>1</sup>	Upper PC type	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T
This parameter is used to set the upper PC type which is classified by the interface of upper PC control drive.							
		Setting value	Upper PC	Control interface			
		[0]	Pulse + analog	Position control/fully-closed-loop: pulse and PTP control Speed control/torque control: analog and internal setting			
		1	Communication bus	485(protocol: Modbus) CAN(protocol: CANopen CiA301/402) PROFIBUS(protocol: PROFIBUS-DPV0)			
P4.10 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1820, 1821	CANopen address	0x240A, 0x00			

P4.11*	Bus servo enabling	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T
Carry out enabling control on the drive via this parameter.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
<b>Note:</b> If the drive is enabled by P0.04, the drive can be disabled if P4.11 is from state 1 to state 0.							
P4.11*	Data size	16bit	Data format	DEC			
	Modbus address	1822, 1823	CANopen address	0x240B, 0x00			

P4.12*	Bus position command	Setting range	Default	Unit	Available mode		
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P		

If P4.10 is 1, the drive position command can be set via this parameter.

P4.12*	Data size	32bit	Data format	DEC		
	Modbus address	1824, 1825	CANopen address	0x240C, 0x00		

P4.13*	Bus speed command	Setting range	Default	Unit	Available mode		
		-20000–20000	0	r/min		S	

If P4.10 is 1, the drive speed command can be set via this parameter.

P4.13*	Data size	16bit	Data format	DEC		
	Modbus address	1826, 1827	CANopen address	0x240D, 0x00		

P4.14*	Bus torque command	Setting range	Default	Unit	Available mode		
		-500.0–500.0	0.0	%			T

If P4.10 is 1, the drive torque command can be set via this parameter.

P4.14*	Data size	16bit	Data format	DEC		
	Modbus address	1828, 1829	CANopen address	0x240E, 0x00		

P4.15*	Switching command of control mode	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter can be used to switch the control mode in hybrid control mode.

Setting value	Function	Actual control mode	
[0]	Disabled	Position/speed	Position
		Position/torque	Position
		Speed/torque	Speed
1	Enabled	Position/speed	Speed
		Position/torque	Torque
		Speed/torque	Torque

**Note:** After the updating of the control mode switching command, the actual switching process of the drive and motor will act based on the setting of P0.90–P.92 and actual feedback state.

P4.15*	Data size	16bit	Data format	DEC		
	Modbus address	1830, 1831	CANopen address	0x240F, 0x00		

P4.16*	Gain switching command	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter can be used to switch the gain of the drive: when P2.22, P2.27, P2.31 is set to 2, switch the actual controlled gain setting.

Setting value	Function	Actual gain
[0]	Disabled	1 <sup>st</sup> gain setting
1	Enabled	2 <sup>nd</sup> gain setting

P4.16*	Data size	16bit	Data format	DEC		
	Modbus address	1832, 1833	CANopen address	0x2410, 0x00		

P4.17*	Switching command of electronic gear ratio	Setting range	Default	Unit	Available mode		
		0-3	0	-	P		
If P4.10 is 1, this parameter can be used to set the switching command of electronic gear ratio.							
	Setting value	Molecule of actual electronic gear ratio	Denominator of actual electronic gear ratio				
	[0]	Molecule of 1 <sup>st</sup> electronic gear ratio (P0.25)	Denominator of electronic gear ratio (P0.26)				
	1	Molecule of 2 <sup>nd</sup> electronic gear ratio (P0.27)					
	2	Molecule of 3 <sup>rd</sup> electronic gear ratio (P0.28)					
	3	Molecule of 4 <sup>th</sup> electronic gear ratio (P0.29)					
P4.17*	Data size	16bit	Data format	DEC			
	Modbus address	1834, 1835	CANopen address	0x2411, 0x00			
P4.18*	Inertia ratio switching command	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can be used to switch the inertia ratio of the drive..							
	Setting value	Function	Actual inertia ratio				
	[0]	Disabled	The first inertia ratio (P1.01)				
	1	Enabled	The second inertia ratio (P1.02)				
P4.18*	Data size	16bit	Data format	DEC			
	Modbus address	1836, 1837	CANopen address	0x2412, 0x00			
P4.19*	Zero speed clamp command	Setting range	Default	Unit	Available mode		
		0-1	0	-		S	T
This parameter can be used to carry out zero speed clamp operation on the drive.							
	Setting value	Function					
	[0]	Disabled					
	1	Enabled					
P4.19*	Data size	16bit	Data format	DEC			
	Modbus address	1838, 1839	CANopen address	0x2413, 0x00			
P4.20*	Retention pulse clearing	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		
This parameter can be used to zero out the retention pulse. The detailed mode is determined by P3.45 and after clearing, R0.04 is 0.							
	Setting value	Function					
	[0]	Disabled					
	1	Enabled					
P4.20*	Data size	16bit	Data format	DEC			
	Modbus address	1840, 1841	CANopen address	0x2414, 0x00			

P4.21*	Torque limit switching command	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can be used to control the torque limit switching.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.21*	Data size	16bit	Data format	DEC			
	Modbus address	1842, 1843	CANopen address	0x2415, 0x00			

P4.22*	External fault command	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can be used to input external fault indication..							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.22*	Data size	16bit	Data format	DEC			
	Modbus address	1844, 1845	CANopen address	0x2416, 0x00			

P4.23*	Emergency stop command	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can be used to carry out emergency-stop operation on the drive.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.23*	Data size	16bit	Data format	DEC			
	Modbus address	1846, 1847	CANopen address	0x2417, 0x00			

P4.24*	Input command of vibration control switching	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		
This parameter can be used to switch the vibration control operation.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.24*	Data size	16bit	Data format	DEC			
	Modbus address	1848, 1849	CANopen address	0x2418, 0x00			

### 6.5.3 Extension and application

P4.30	Stop mode	Setting range	Default	Unit	Available mode		
		0-3	0	-	P	S	T
When the servo is turned OFF and when fault alarm occurs, this parameter is used to set whether the dynamic brake works or not and the state of the servo motor after stop:							

P4.30 Setting value	Action	
	During deceleration	After stopping
[0]	Coast to stop	Keep the inertia operation state
1	Dynamic brake to stop	Keep the inertia operation state
2	Dynamic brake stop	Dynamic braking state
3	External dynamic brake acts	Dynamic braking state

**Note:**

- When P4.30 is set to 1, the dynamic brake works when motor speed is higher than the value of P3.58 and does not work otherwise. After motor stops, dynamic brake will stop working.
- If the running speed of servo motor is faster than rated speed, do not use the dynamic brake. If the running speed is high with large inertia load, please use the dynamic brake with caution. Do not start the dynamic brake frequently; otherwise, damage may occur to the servo drive.

P4.30	Data size	16bit	Data format	DEC
	Modbus address	1860, 1861	CANopen address	0x241E, 0x00

P4.31	Max. speed limit	Setting range	Default	Unit	Available mode		
		0–20000	5000	r/min	P	S	T

This parameter can be used to set the highest running speed of servo motor. If the absolute value of the speed command is larger than the value of this parameter, the magnitude of the actual speed setting will be limited by this parameter; the direction is the same with that of the original speed command. This parameter is active in all modes.

**Note:** The default value of this parameter is related to the power level of the drive.

P4.31	Data size	16bit	Data format	DEC
	Modbus address	1862, 1863	CANopen address	0x241F, 0x00

P4.32	Overspeed level	Setting range	Default	Unit	Available mode		
		0–20000	6000	r/min	P	S	T

This parameter is used to set the overspeed level of the servo motor. When the rotation speed of the motor exceeds this setting speed, overspeed fault alarm will be reported.

**Note:** The default value of this parameter is related to the power level of the drive.

P4.32	Data size	16bit	Data format	DEC
	Modbus address	1864, 1865	CANopen address	0x2420, 0x00

P4.33	Pulse range of position deviation	Setting range	Default	Unit	Available mode		
		0–2 <sup>27</sup>	100000	reference unit	P		

This parameter is used to set the alarm threshold for the position deviation (Er22-0). In position mode, when the number of retention pulses exceeds this setting value, position error fault will be alarmed. When P4.33=0, it means position error will not be detected.

P4.33	Data size	32bit	Data format	DEC
	Modbus address	1866, 1867	CANopen address	0x2421, 0x00

P4.34 <sup>1</sup>	Brake overload detection selection	Setting range	Default	Unit	Available mode		
		0-2	0	-	P	S	T
This parameter is used to set the regenerative brake mode and overload protection mode.							
		Setting value	Regenerative brake and overload protection				
		[0]	Disabled (no regenerative brake)				
		1	Embedded				
		2	External				
P4.34 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1868, 1869	CANopen address	0x2422, 0x00			
P4.35	Enable out-of-control speed detection	Setting range	Default	Unit	Available mode		
		0-1	1	-	P	S	T
This parameter is used to enable or disable the detection on out-of-control speed.							
		Setting value	Function				
		0	Disabled				
		[1]	Enabled				
P4.35	Data size	16bit	Data format	DEC			
	Modbus address	1870, 1871	CANopen address	0x2423, 0x00			
P4.36 <sup>1</sup>	Undervoltage protection of main power supply	Setting range	Default	Unit	Available mode		
		0-1	1	-	P	S	T
This parameter is used to set whether the drive will report main circuit undervoltage alarm when undervoltage occurs to the main power supply.							
		Setting value	Protection				
		0	Do not display the undervoltage fault of the main circuit (Er13-1)				
		[1]	Display the undervoltage fault of the main circuit (Er13-1) and stop				
P4.36 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1872, 1873	CANopen address	0x2424, 0x00			
P4.37	Undervoltage detection time of main power supply	Setting range	Default	Unit	Available mode		
		70-2000	70	ms	P	S	T
This parameter is used to set the undervoltage detection time of the main power supply.							
<b>Note:</b> The function is invalid if it is set to 2000.							
P4.37	Data size	16bit	Data format	DEC			
	Modbus address	1874, 1875	CANopen address	0x2425, 0x00			
P4.38	Motor overload rate	Setting range	Default	Unit	Available mode		
		0.0-500.0	115.0	%	P	S	T
This parameter is used to set the overload rate of motor.							
The default value is 115.0%. When increasing the value of this parameter, please take the motor overload capacity into consideration.							

P4.38	Data size	16bit	Data format	DEC
	Modbus address	1876, 1877	CANopen address	0x2426, 0x00

P4.39	Speed deviation setting	Setting range	Default	Unit	Available mode		
		0-20000	0	r/min	P	S	

This parameter is used to set the detection condition of the speed error. If the absolute value of the minus of actual speed command and motor speed is larger than this value and lasts for more than 100ms, it will report speed error alarm.

**Note:** If it is set to 0, the speed error will not be detected.

P4.39	Data size	16bit	Data format	DEC
	Modbus address	1878, 1879	CANopen address	0x2427, 0x00

P4.40	Forward speed limit	Setting range	Default	Unit	Available mode		
		0-20000	20000	r/min	P	S	T

This parameter is used to set the max. speed limit for forward speed command.

**Note:** The default value and setting range of the parameter is relative to the drive power level.

P4.40	Data size	16bit	Data format	DEC
	Modbus address	1880, 1881	CANopen address	0x2428, 0x00

P4.41	Reverse speed limit	Setting range	Default	Unit	Available mode		
		-20000-0	-20000	r/min	P	S	T

This parameter is used to set the max. speed limit of reverse speed command.

**Note:** The default value and setting range of the parameter is relative to the drive power level.

P4.41	Data size	16bit	Data format	DEC
	Modbus address	1882, 1883	CANopen address	0x2429, 0x00

P4.42	Internal speed of high resolution	Setting range	Default	Unit	Available mode		
		-20000.0-20000.0	0.0	r/min		S	

This parameter is used to set the internal speed of high resolution

P4.42	Data size	32bit	Data format	DEC
	Modbus address	1884, 1885	CANopen address	0x242A, 0x00

P4.45	Temperature protection threshold of medium-power motor	Setting range	Default	Unit	Available mode		
		0-200	0	℃	P	S	T

Support temperature sampling of temperature resistor KTY84-130. When the temperature exceeds the value set by P4.45, motor overtemperature fault will be reported. If P4.45 is set to 0, temperature sampling will not be conducted.

P4.45	Data size	16bit	Data format	DEC
	Modbus address	1890, 1891	CANopen address	0x242D, 0x00

P4.50 <sup>1</sup>	Offset of encoder Z phase	Setting range	Default	Unit	Available mode		
		0-(2 <sup>20</sup> -1)	0	pulse	P	S	T

This parameter is used to set the output position of Z phase, and the setting value of the offset of Z phase is the pulse of CCW direction.				
P4.50 <sup>1</sup>	Data size	32bit	Data format	DEC
	Modbus address	1900, 1901	CANopen address	0x2432, 0x00

P4.51	Switching time 1 of torque limit	Setting range	Default	Unit	Available mode		
		0–4000	0	ms/(100%)	P	S	
This parameter is used to set the transition time between switching from the first torque limit to the second torque limit.							
P4.51	Data size	16bit	Data format	DEC			
	Modbus address	1902, 1903	CANopen address	0x2433, 0x00			

P4.52	Switching time 2 of torque limit	Setting range	Default	Unit	Available mode		
		0–4000	0	ms/(100%)	P	S	
This parameter is used to set the transition time between switching from the second torque limit to the first torque limit.							
P4.52	Data size	16bit	Data format	DEC			
	Modbus address	1904, 1905	CANopen address	0x2434, 0x00			

P4.53	Current loop response adjustment	Setting range	Default	Unit	Available mode		
		10.0–200.0	100.0	%	P	S	T
This parameter is used to set the adjustment coefficient of current loop response width.							
P4.53	Data size	16bit	Data format	DEC			
	Modbus address	1906, 1907	CANopen address	0x2435, 0x00			

P4.54 <sup>1</sup>	Initialization time after power on	Setting range	Default	Unit	Available mode		
		0–200000	0	ms	P	S	T
This parameter is used to set the delay time before allowing servo enabling after power on initialization is completed.							
P4.54 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1908, 1909	CANopen address	0x2436, 0x00			

#### 6.5.4 Frequency-division output and setup of the 2<sup>nd</sup> encoder

P4.58 <sup>1</sup>	Z pulse width of frequency-division output	Setting range	Default	Unit	Available mode		
		1–255	2	pulse	P	S	T
Set the Z pulse width of frequency-division output; valid only when P4.69=0 [normal frequency-division output].							
P4.58 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1916, 1917	CANopen address	0x243A, 0x00			

P4.59	Z pulse offset of frequency-division output	Setting range	Default	Unit	Available mode		
		0–(2 <sup>31</sup> -1)	0	pulse	P	S	T
Set the Z pulse offset of frequency-division output. The max offset cannot exceed the single-turn resolution of frequency-division output. It is valid only when P4.69=0 [normal frequency-division output].							
P4.59	Data size	32bit	Data format	DEC			
	Modbus address	1918, 1919	CANopen address	0x243B, 0x00			

P4.60 <sup>1</sup>	Frequency division molecular of external linear encoder	Setting range	Default	Unit	Available mode		
		1–(2 <sup>31</sup> -1)	10000	-	P		
This parameter is used to set the frequency division molecular of external linear encoder.							
P4.60 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1920, 1921	CANopen address	0x243C, 0x00			

P4.61 <sup>1</sup>	Frequency division denominator of external linear encoder	Setting range	Default	Unit	Available mode		
		1–(2 <sup>31</sup> -1)	10000	-	P		
This parameter is used to set the frequency division denominator of external linear encoder, which corresponds to the linear encoder pulse number needed by one-circle rotation of motor.							
P4.61 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1922, 1923	CANopen address	0x243D, 0x00			

P4.62 <sup>1</sup>	Direction reversal of external linear encoder	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
This parameter is used to set the direction reversal of external linear encoder feedback counting.							
		Setting value	Function				
		[0]	Use the counting value of the linear encoder directly				
		1	Use after the reversing of the counting value of the linear encoder				
P4.62 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	1924, 1925	CANopen address	0x243E, 0x00			

P4.64 <sup>1</sup>	Large mixed deviation setting	Setting range	Default	Unit	Available mode		
		1–2 <sup>27</sup>	160000	reference unit	P		
In the fully-closed loop control, set the tolerance (mixed deviation) between the user unit (reference unit) corresponding to the encoder feedback position and user unit (reference unit) corresponding to the linear encoder feedback position. If R0.05 exceeds the setting value, the drive will report Er22-1.							
P4.64 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	1928, 1929	CANopen address	0x2440, 0x00			

P4.65 <sup>1</sup>	Mixed deviation clearing	Setting range	Default	Unit	Available mode		
		0–100	0	circle	P		

This parameter is used to set the condition of mixed control deviation clearing. After rotating for the set circles, the mixed control deviation will be cleared. If it is set to 0, the deviation will not be cleared.

P4.65 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1930, 1931	CANopen address	0x2441, 0x00

P4.67 <sup>1</sup>	External grating pulse output mode of AB phase	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		

It is used to set the signal source of pulse feedback output when fully-closed loop function is enabled under position mode.

Setting value	Pulse feedback signal source
[0]	Encoder feedback
1	Linear encoder feedback

P4.67 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1934, 1935	CANopen address	0x2443, 0x00

P4.68 <sup>1</sup>	External linear encoder (2 <sup>nd</sup> encoder) resolution	Setting range	Default	Unit	Available mode		
		1-(2 <sup>31</sup> -1)	10000	pulse	P		

Set the resolution of external linear encoder (2<sup>nd</sup> encoder). When connecting 2<sup>nd</sup> encoder, output the number of pulses per circle.

P4.68 <sup>1</sup>	Data size	32bit	Data format	DEC
	Modbus address	1936, 1937	CANopen address	0x2444, 0x00

P4.69 <sup>1</sup>	Frequency division output source	Setting range	Default	Unit	Available mode		
		0-4	0	-	P	S	T

Set the signal source of frequency division output.

Setting value	Pulse feedback signal source
[0]	Normal frequency-division output
1	2 <sup>nd</sup> encoder bypass
2	AB quadrature pulse input bypass
3	Internal virtual spindle
4	The 1 <sup>st</sup> encoder bypass (valid only for incremental encoder)

P4.69 <sup>1</sup>	Data size	32bit	Data format	DEC
	Modbus address	1938, 1939	CANopen address	0x2445, 0x00

P4.70 <sup>1</sup>	External linear encoder (2 <sup>nd</sup> encoder) Z signal type	Setting range	Default	Unit	Available mode		
		0-3	0	-	P	S	T

As Z signal width is divided into 1/4, 1/2 and 1/1, the starting phase of the signal for each width corresponds to 4 kinds of AB level, so there are in total 12 kinds of combinations, however, in order to adapt to these combinations and ensure the capture value is normal in both forward and reverse direction, it is necessary to set the AB state value corresponds to the middle of Z signal high level. For 1/4 and 1/2, they require any one of AB states during high level period after Z type

signal setting; for 1/1 width encoder, the set Z type must be the AB value corresponds to the middle of high level.

P4.70 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1940, 1941	CANopen address	0x2446, 0x00

P4.78 <sup>1</sup>	MotionNet node number	Setting range	Default	Unit	Available mode		
		0-63	0	-	P	S	T

Set communication node number of local machine (slave station) in MotionNet communication.

P4.78 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1956, 1957	CANopen address	0x244E, 0x00

P4.79 <sup>1</sup>	MotionNet baud rate	Setting range	Default	Unit	Available mode		
		0-3	2	-	P	S	T

Set MotionNet baud rate as follows:

Setting value	Baud rate
0	2.5Mbps
1	5.0Mbps
[2]	10.0Mbps
3	20.0Mbps

P4.79 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	1958, 1959	CANopen address	0x244F, 0x00

P4.80	Configuration of PZD setting parameter 1	Setting range	Default	Unit	Available mode		
		1000-3999	1998	-	P	S	T

This parameter is used to set the mapping content of setting parameter 1 in PROFIBUS-DP communication (1998 corresponds to the reserved parameters).

P4.80	Data size	16bit	Data format	DEC
	Modbus address	1960, 1961	CANopen address	0x2450, 0x00

P4.81	Configuration of PZD setting parameter 2	Setting range	Default	Unit	Available mode		
		1000-3999	1998	-	P	S	T

This parameter is used to set the mapping content of setting parameter 2 in PROFIBUS-DP communication (1998 corresponds to the reserved parameters).

P4.81	Data size	16bit	Data format	DEC
	Modbus address	1962, 1963	CANopen address	0x2451, 0x00

P4.82	Configuration of PZD setting parameter 3	Setting range	Default	Unit	Available mode		
		1000-3999	1998	-	P	S	T

This parameter is used to set the mapping content of setting parameter 3 in PROFIBUS-DP communication (1998 corresponds to the reserved parameters).

P4.82	Data size	16bit	Data format	DEC
	Modbus address	1964, 1965	CANopen address	0x2452, 0x00

P4.83	Configuration of PZD feedback parameter 1	Setting range	Default	Unit	Available mode		
		4000–5852	4012	-	P	S	T
This parameter is used to set the mapping content of feedback parameter 1 in PROFIBUS-DP communication (4012 corresponds to R0.04).							
P4.83	Data size	16bit	Data format	DEC			
	Modbus address	1966, 1967	CANopen address	0x2453, 0x00			

P4.84	Configuration of PZD feedback parameter 2	Setting range	Default	Unit	Available mode		
		4000–5852	4018	-	P	S	T
This parameter is used to set the mapping content of feedback parameter 2 in PROFIBUS-DP communication (4018 corresponds to R0.07).							
P4.84	Data size	16bit	Data format	DEC			
	Modbus address	1968, 1969	CANopen address	0x2454, 0x00			

P4.85	Configuration of PZD feedback parameter 3	Setting range	Default	Unit	Available mode		
		4000–5852	4032	-	P	S	T
This parameter is used to set the mapping content of feedback parameter 3 in PROFIBUS-DP communication (4032 corresponds to R0.14).							
P4.85	Data size	16bit	Data format	DEC			
	Modbus address	1970, 1971	CANopen address	0x2455, 0x00			

P4.86	PPO type of DP communication	Setting range	Default	Unit	Available mode							
		5	5	-	P	S	T					
This parameter is used to set the frame type of PROFIBUS-DP communication.												
<b>Note:</b> SV-DA200 only supports PROFIBUS-DPV0 and the PPO only supports 5.												

P4.86	Data size	16bit	Data format	DEC			
	Modbus address	1972, 1973	CANopen address	0x2456, 0x00			

P4.87	CANopen communication cycle	Setting range	Default	Unit	Available mode		
		0–(2 <sup>31</sup> -1)	0	μs	P	S	T
CANopen communication cycle of the slave station.							
<b>Note:</b> The recommended unit for setting is 1000μs.							

P4.87	Data size	32bit	Data format	DEC
	Modbus address	1974, 1975	CANopen address	0x2457, 0x00

P4.88	CANopen heartbeat cycle	Setting range	Default	Unit	Available mode		
		0–32767	1000	ms	P	S	T

CANopen heartbeat cycle of the salve station.

P4.88	Data size	16bit	Data format	DEC
	Modbus address	1976, 1977	CANopen address	0x2458, 0x00

P4.89	Automatic stop at CANopen disconnection	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

Set whether to stop at CANopen disconnection by this parameter:

Setting value	Function
[0]	Disabled
1	Enabled

P4.89	Data size	16bit	Data format	DEC
	Modbus address	1978, 1979	CANopen address	0x2459, 0x00

### 6.5.5 Special instruction

P4.90*	Fault restore	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

This parameter can be set by upper PC via communication mode to clear drive fault.

Setting value	Function
[0]	Disabled
1	Enabled

#### Note:

1. If the fault restore command is enabled, and the servo drive is disabled, if the fault cannot happen, the fault can be restored automatically. But other faults cannot be cleared online but be cleared at re-power on
2. The user can clear the fault through LED panel.

P4.90*	Data size	16bit	Data format	DEC
	Modbus address	1980, 1981	CANopen address	0x245A, 0x00

P4.91*	Parameters saving	Setting range	Default	Unit	Available mode		
		0–1	0	-	P	S	T

If P0.17 is 1 (bulk saving), the saving command can be sent via this parameter to write the changed savable parameter into EEPROM.

Setting value	Function
[0]	Disabled
1	Enabled

P4.91*	Data size	16bit	Data format	DEC
	Modbus address	1982, 1983	CANopen address	0x245B, 0x00

P4.92*	Restore to factory value	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
After this operation, all parameters (P0-P6 group) can be restored to the default value.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.92*	Data size	16bit	Data format	DEC			
	Modbus address	1984, 1985	CANopen address	0x245C, 0x00			

P4.93*	Reading enable of fault record	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can set the enabling of reading the fault record.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.93*	Data size	16bit	Data format	DEC			
	Modbus address	1986, 1987	CANopen address	0x245D, 0x00			

P4.94*	Clearing enable of fault record	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can set the enabling of clearing the fault record.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P4.94*	Data size	16bit	Data format	DEC			
	Modbus address	1988, 1989	CANopen address	0x245E, 0x00			

P4.95*	Group number of fault record	Setting range	Default	Unit	Available mode		
		0-9	0	-	P	S	T
This parameter can set the group number of fault record. 0 corresponds to the group 1 fault recorded which is also the latest one, 9 corresponds to group 10 fault recorded which is also the earliest one.							
P4.95*	Data size	16bit	Data format	DEC			
	Modbus address	1990, 1991	CANopen address	0x245F, 0x00			

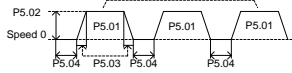

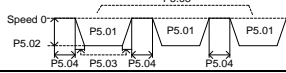

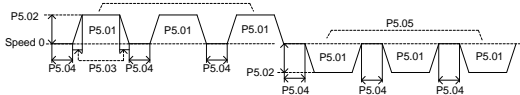

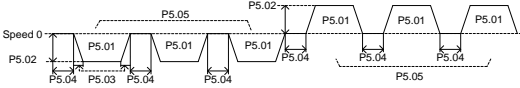

P4.96*	Reserved	Setting range	Default	Unit	Available mode		
		-	-	-	P	S	T
It is forbidden to modify this parameter.							
P4.96*	Data size	16bit	Data format	DEC			
	Modbus address	1992, 1993	CANopen address	0x2460, 0x00			

P4.97*	EEPROM operation of communication encoder	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
All the motor parameters can be written into the EEPROM and during the starting, the drive will initialize the data of the relative parameters.							
P4.97*	Data size	16bit	Data format	DEC			
	Modbus address	1994, 1995	CANopen address	0x2461, 0x00			

P4.98*	EEPROM data fault block of communication encoder	Setting range	Default	Unit	Available mode		
		0-1	0	-	P	S	T
This parameter can be used to block the no data and data error fault of encoder EEPROM. If Er2-c or Er2-d occurs, set correct motor model and power on, the motor can be used after re-power on, and then the drive will initialize relative parameters with motor data in EEPROM.							
P4.98*	Data size	16bit	Data format	DEC			
	Modbus address	1996, 1997	CANopen address	0x2462, 0x00			

## 6.6 Program JOG, homing and PTP control (P5)

### 6.6.1 Program JOG

P5.00	JOG mode	Setting range	Default	Unit	Available mode		
		0-6	0	-	P		
This parameter is used to set the JOG operation mode:							
Mode	Start key	Function					
[0]		(waiting time P5.04→forward moving P5.01) × cycle time P5.05 					
1		(waiting time P5.04→reverse moving P5.01) × cycle time P5.05 					
2		(waiting time P5.04→forward moving P5.01) × cycle time P5.05 →(waiting time P5.04→reverse moving P5.01) × cycle time P5.05 					
3		(waiting time P5.04→reverse moving P5.01) × cycle time P5.05 →(waiting time P5.04→forward moving P5.01) × cycle time P5.05 					
4		(waiting time P5.04→forward moving P5.01→waiting time P5.04 →reverse moving P5.01) × cycle time P5.05 					

P5.00	Data size	16bit	Data format	DEC
	Modbus address	2000, 2001	CANopen address	0x2500, 0x00

P5.01	JOG movement amount	Setting range	Default	Unit	Available mode	
		1-2 <sup>30</sup>	50000	reference unit	P	

This parameter is used to set the increment of position movement amount of JOG.

P5.01	Data size	32bit	Data format	DEC
	Modbus address	2002, 2003	CANopen address	0x2501, 0x00

P5.02	JOG speed setting	Setting range	Default	Unit	Available mode	
		1-5000	500	r/min	P	

This parameter is used to set the highest running speed of JOG.

P5.02	Data size	16bit	Data format	DEC
	Modbus address	2004, 2005	CANopen address	0x2502, 0x00

P5.03	JOG ACC/DEC time	Setting range	Default	Unit	Available mode	
		2-10000	100	ms	P	

This parameter is used to set the JOG ACC/DEC time and the time corresponds to the time from zero speed to the rated speed. For example, if the target speed is from zero speed to 50% of the rated speed, it is 50% of the time to the target speed.

P5.03	Data size	16bit	Data format	DEC
	Modbus address	2006, 2007	CANopen address	0x2503, 0x00

P5.04	JOG waiting time	Setting range	Default	Unit	Available mode	
		0-10000	100	ms	P	

This parameter is used to set JOG waiting time and the time is from JOG starting to actual operation time or the time from the finishing of one displacement to the starting of next displacement.

P5.04	Data size	16bit	Data format	DEC
	Modbus address	2008, 2009	CANopen address	0x2504, 0x00

P5.05	JOG cycle times	Setting range	Default	Unit	Available mode	
		0-10000	1	-	P	
This parameter is used to set the JOG cycle times. Please refer to P5.00.						
P5.05	Data size	16bit	Data format	DEC		
	Modbus address	2010, 2011	CANopen address	0x2505, 0x00		

6.6.2 Homing

P5.10 <sup>2</sup>	Homing mode	Setting range	Default	Unit	Available mode	
		0-128	0	-	P	

This parameter is used to set the homing mode.

Display mode: DEC

- M: Homing mode
- Z: Finding Z mode
- T: Limit mode
- R: Reserved

R	T	Z	M
	Limit mode	Finding Z mode	Homing mode
	0-1	0-2	0-8
	T: Invalid	Z=0: define the point of finding Z as the home;	M=0: forward rotation, the forward limit switch is the returning point
	T: Invalid	Z=1 define the point of finding Z as the home;	M=1:reverse rotation, the reverse limit switch is the returning point
	To the limit: T=0: report the exceeding fault T=1: direction reverse	Z=2: not finding Z, define the returning point as the home	M=2: forward rotation, the rising edge of the home switch is the returning point M=3:reverse rotation, the rising edge of the home switch is the returning point
Reserved		Z: Invalid	M=4: forward rotation, the first Z signal is the returning point
		Z: Invalid	M=5: reverse rotation, the first Z signal is the returning point
		define the point of finding Z as the home; Z=1 define the point of finding Z as the home; Z=2: not finding Z, define the returning point as the home	M=6: forward rotation, the declining edge of the home switch is the returning point M=7: reverse rotation, the declining edge of the home switch is the returning point
	T: Invalid	Z: Invalid	M=8: the current position is defined as the home.

P5.10 <sup>2</sup>	Data size	16bit	Data format	DEC
	Modbus address	2020, 2021	CANopen address	0x2505, 0x00

P5.11	Homing automatically after power on	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

This parameter is used to set whether it can return to home automatically after power on.

Setting value	Instruction
[0]	Invalid
1	Valid

**Note:** It is valid when no fault occurs.

P5.11	Data size	16bit	Data format	DEC
	Modbus address	2022, 2023	CANopen address	0x250B, 0x00

P5.12	High speed of 1 <sup>st</sup> step of homing	Setting range	Default	Unit	Available mode	
		0-2000	100	r/min	P	

This parameter is used to set the high speed of 1<sup>st</sup> step of homing.

Diagram:

P5.12	Data size	16bit	Data format	DEC
	Modbus address	2024, 2025	CANopen address	0x250C, 0x00

P5.13	Low speed of 2 <sup>nd</sup> step of homing	Setting range	Default	Unit	Available mode	
		0-60	20	r/min	P	

This parameter is used to set the low speed of 2<sup>nd</sup> step of homing. See details at P5.12.

P5.13	Data size	16bit	Data format	DEC
	Modbus address	2026, 2027	CANopen address	0x250D, 0x00

P5.14	Home setting	Setting range	Default	Unit	Available mode	
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P	

This parameter is used to set the value of the home.

P5.14	Data size	32bit	Data format	DEC
	Modbus address	2028, 2029	CANopen address	0x250E, 0x00

P5.15*	Trigger command of homing	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

This parameter is used to trigger the homing command. It has the same function with HOME (0x017 or 0x117) of the digital output.

P5.15*	Data size	16bit	Data format	DEC
	Modbus address	2030, 2031	CANopen address	0x250F, 0x00

P5.16	Correlated action of homing	Setting range	Default	Unit	Available mode		
		0-3	1	-	P		

Set the correlated action of homing via this parameter

Setting value	Function
0	No action
[1]	To the designated target position
2	To the specified 0 <sup>th</sup> PTP position.
3	To the designated target position directly without homing

P5.16	Data size	16bit	Data format	DEC
	Modbus address	2032, 2033	CANopen address	0x2510, 0x00

P5.17	Speed to designated target after homing	Setting range	Default	Unit	Available mode		
		1-5000	100	r/min	P		

Set to reach the target speed after homing by this parameter. Modifications made before homing will be valid.

P5.17	Data size	16bit	Data format	DEC
	Modbus address	2034, 2035	CANopen address	0x2511, 0x00

P5.18	ACC/DEC time to designated target after homing	Setting range	Default	Unit	Available mode		
		0-32767	300	ms	P		

This function is used to set the ACC/DEC time of reaching the target after homing. The setting value corresponds to the time needed to accelerate from zero speed to rated speed. For instance, the target speed is to accelerate from zero speed to 50% rated speed, then time of reaching the target speed of the speed command is 50% of the setting value.

P5.18	Data size	16bit	Data format	DEC
	Modbus address	2036, 2037	CANopen address	0x2512, 0x00

P5.19	Position to designated target after homing	Setting range	Default	Unit	Available mode		
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P		

Set to go to the designated target position after homing via this parameter

P5.19	Data size	32bit	Data format	DEC
	Modbus address	2038, 2039	CANopen address	0x2513, 0x00

### 6.6.3 PTP (Point-to-Point) control

P5.20*	PTP trigger command	Setting range	Default	Unit	Available mode		
		-1-2048	-1	-	P		

This parameter is used to trigger the target PTP.

Write: PTP trigger, the internal buffer can receive 8 trigger signals at most.

Signal	Function
[-1]	Invalid
0-127	Control 0-127 step, equivalent to digital input: TRIG + POSn function.
128-2047	Invalid
2048	Forced to stop

Example: Writing PTP signal 3 means to trigger the PTP program 3.

P5.20*	Data size	16bit	Data format	DEC
	Modbus address	2040, 2041	CANopen address	0x2514, 0x00

P5.21	00 target speed	Setting range	Default	Unit	Available mode		
		0-6000	20	r/min	P		
P5.22	01 target speed	Setting range	Default	Unit	Available mode		
		0-6000	50	r/min	P		
P5.23	02 target speed	Setting range	Default	Unit	Available mode		
		0-6000	100	r/min	P		
P5.24	03 target speed	Setting range	Default	Unit	Available mode		
		0-6000	200	r/min	P		
P5.25	04 target speed	Setting range	Default	Unit	Available mode		
		0-6000	300	r/min	P		
P5.26	05 target speed	Setting range	Default	Unit	Available mode		
		0-6000	500	r/min	P		
P5.27	06 target speed	Setting range	Default	Unit	Available mode		
		0-6000	600	r/min	P		
P5.28	07 target speed	Setting range	Default	Unit	Available mode		
		0-6000	800	r/min	P		
P5.29	08 target speed	Setting range	Default	Unit	Available mode		
		0-6000	1000	r/min	P		
P5.30	09 target speed	Setting range	Default	Unit	Available mode		
		0-6000	1300	r/min	P		
P5.31	10 target speed	Setting range	Default	Unit	Available mode		
		0-6000	1500	r/min	P		
P5.32	11 target speed	Setting range	Default	Unit	Available mode		
		0-6000	1800	r/min	P		
P5.33	12 target speed	Setting range	Default	Unit	Available mode		
		0-6000	2000	r/min	P		
P5.34	13 target speed	Setting range	Default	Unit	Available mode		
		0-6000	2300	r/min	P		
P5.35	14 target speed	Setting range	Default	Unit	Available mode		
		0-6000	2500	r/min	P		

P5.36	15 target speed	Setting range	Default	Unit	Available mode		
		0–6000	3000	r/min	P		
These parameters are used to set the target speed of each step bit.							
P5.21	Data size	16bit	Data format	DEC			
	Modbus address	2042, 2043	CANopen address	0x2515, 0x00			
P5.22	Data size	16bit	Data format	DEC			
	Modbus address	2044, 2045	CANopen address	0x2516, 0x00			
P5.23	Data size	16bit	Data format	DEC			
	Modbus address	2046, 2047	CANopen address	0x2517, 0x00			
P5.24	Data size	16bit	Data format	DEC			
	Modbus address	2048, 2049	CANopen address	0x2518, 0x00			
P5.25	Data size	16bit	Data format	DEC			
	Modbus address	2050, 2051	CANopen address	0x2519, 0x00			
P5.26	Data size	16bit	Data format	DEC

P5.27	Data size	16bit	Data format	DEC			
	Modbus address	2054, 2055	CANopen address	0x251B, 0x00			
P5.28	Data size	16bit	Data format	DEC			
	Modbus address	2056, 2057	CANopen address	0x251C, 0x00			
P5.29	Data size	16bit	Data format	DEC			
	Modbus address	2058, 2059	CANopen address	0x251D, 0x00			
P5.30	Data size	16bit	Data format	DEC			
	Modbus address	2060, 2061	CANopen address	0x251E, 0x00			
P5.31	Data size	16bit	Data format	DEC			
	Modbus address	2062, 2063	CANopen address	0x251F, 0x00			
P5.32	Data size	16bit	Data format	DEC			
	Modbus address	2064, 2065	CANopen address	0x2520, 0x00			
P5.33	Data size	16bit	Data format	DEC			
	Modbus address	2066, 2067	CANopen address	0x2521, 0x00			
P5.34	Data size	16bit	Data format	DEC			
	Modbus address	2068, 2069	CANopen address	0x2522, 0x00			
P5.35	Data size	16bit	Data format	DEC			
	Modbus address	2070, 2071	CANopen address	0x2523, 0x00			
P5.36	Data size	16bit	Data format	DEC			
	Modbus address	2072, 2073	CANopen address	0x2524, 0x00			
P5.37	00 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0–32767	200	ms	P		
P5.38	01 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0–32767	300	ms	P		

P5.39	02 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	500	ms	P		
P5.40	03 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	600	ms	P		
P5.41	04 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	800	ms	P		
P5.42	05 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	900	ms	P		
P5.43	06 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	1000	ms	P		
P5.44	07 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	1200	ms	P		
P5.45	08 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	1500	ms	P		
P5.46	09 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	2000	ms	P		
P5.47	10 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	2500	ms	P		
P5.48	11 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	3000	ms	P		
P5.49	12 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	5000	ms	P		
P5.50	13 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	8000	ms	P		
P5.51	14 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	50	ms	P		
P5.52	15 ACC/DEC time	Setting range	Default	Unit	Available mode		
		0-32767	30	ms	P		

These parameters are used to set the ACC/DEC time of each step bit.

P5.37	Data size	16bit	Data format	DEC
	Modbus address	2074, 2075	CANopen address	0x2525, 0x00
P5.38	Data size	16bit	Data format	DEC
	Modbus address	2076, 2077	CANopen address	0x2526, 0x00
P5.39	Data size	16bit	Data format	DEC
	Modbus address	2078, 2079	CANopen address	0x2527, 0x00
P5.40	Data size	16bit	Data format	DEC
	Modbus address	2080, 2081	CANopen address	0x2528, 0x00
P5.41	Data size	16bit	Data format	DEC
	Modbus address	2082, 2083	CANopen address	0x2529, 0x00

P5.42	Data size	16bit	Data format	DEC
	Modbus address	2084, 2085	CANopen address	0x252A, 0x00
P5.43	Data size	16bit	Data format	DEC
	Modbus address	2086, 2087	CANopen address	0x252B, 0x00
P5.44	Data size	16bit	Data format	DEC
	Modbus address	2088, 2089	CANopen address	0x252C, 0x00
P5.45	Data size	16bit	Data format	DEC

P5.46	Data size	16bit	Data format	DEC
	Modbus address	2092, 2093	CANopen address	0x252E, 0x00
P5.47	Data size	16bit	Data format	DEC
	Modbus address	2094, 2095	CANopen address	0x252F, 0x00
P5.48	Data size	16bit	Data format	DEC
	Modbus address	2096, 2097	CANopen address	0x2530, 0x00
P5.49	Data size	16bit	Data format	DEC
	Modbus address	2098, 2099	CANopen address	0x2531, 0x00
P5.50	Data size	16bit	Data format	DEC
	Modbus address	2100, 2101	CANopen address	0x2532, 0x00
P5.51	Data size	16bit	Data format	DEC
	Modbus address	2102, 2103	CANopen address	0x2533, 0x00
P5.52	Data size	16bit	Data format	DEC
	Modbus address	2104, 2105	CANopen address	0x2534, 0x00

P5.53	00 delay time	Setting range	Default	Unit	Available mode		
		0–32767	0	ms	P		
P5.54	01 delay time	Setting range	Default	Unit	Available mode		
		0–32767	100	ms	P		
P5.55	02 delay time	Setting range	Default	Unit	Available mode		
		0–32767	200	ms	P		
P5.56	03 delay time	Setting range	Default	Unit	Available mode		
		0–32767	400	ms	P		
P5.57	04 delay time	Setting range	Default	Unit	Available mode		
		0–32767	500	ms	P		
P5.58	05 delay time	Setting range	Default	Unit	Available mode		
		0–32767	800	ms	P		
P5.59	06 delay time	Setting range	Default	Unit	Available mode		
		0–32767	1000	ms	P		
P5.60	07 delay time	Setting range	Default	Unit	Available mode		
		0–32767	1500	ms	P		

P5.61	08 delay time	Setting range	Default	Unit	Available mode		
		0-32767	2000	ms	P		
P5.62	09 delay time	Setting range	Default	Unit	Available mode		
		0-32767	2500	ms	P		
P5.63	10 delay time	Setting range	Default	Unit	Available mode		
		0-32767	3000	ms	P		
P5.64	11 delay time	Setting range	Default	Unit	Available mode		
		0-32767	3500	ms	P		
P5.65	12 delay time	Setting range	Default	Unit	Available mode		
		0-32767	4000	ms	P		
P5.66	13 delay time	Setting range	Default	Unit	Available mode		
		0-32767	4500	ms	P		
P5.67	14 delay time	Setting range	Default	Unit	Available mode		
		0-32767	5000	ms	P		
P5.68	15 delay time	Setting range	Default	Unit	Available mode		
		0-32767	5500	ms	P		

These parameters are used to set the delay time of each step bit.

P5.53	Data size	16bit	Data format	DEC
	Modbus address	2106, 2107	CANopen address	0x2535, 0x00
P5.54	Data size	16bit	Data format	DEC
	Modbus address	2108, 2109	CANopen address	0x2536, 0x00
P5.55	Data size	16bit	Data format	DEC
	Modbus address	2110, 2111	CANopen address	0x2537, 0x00
P5.56	Data size	16bit	Data format	DEC
	Modbus address	2112, 2113	CANopen address	0x2538, 0x00
P5.57	Data size	16bit	Data format	DEC
	Modbus address	2114, 2115	CANopen address	0x2539, 0x00
P5.58	Data size	16bit	Data format	DEC
	Modbus address	2116, 2117	CANopen address	0x253A, 0x00
P5.59	Data size	16bit	Data format	DEC
	Modbus address	2118, 2119	CANopen address	0x253B, 0x00
P5.60	Data size	16bit	Data format	DEC
	Modbus address	2120, 2121	CANopen address	0x253C, 0x00
P5.61	Data size	16bit	Data format	DEC
	Modbus address	2122, 2123	CANopen address	0x253D, 0x00
P5.62	Data size	16bit	Data format	DEC
	Modbus address	2124, 2125	CANopen address	0x253E, 0x00
P5.63	Data size	16bit	Data format	DEC
	Modbus address	2126, 2127	CANopen address	0x253F, 0x00

P5.64	Data size	16bit	Data format	DEC
	Modbus address	2128, 2129	CANopen address	0x2540, 0x00
P5.65	Data size	16bit	Data format	DEC
	Modbus address	2130, 2131	CANopen address	0x2541, 0x00
P5.66	Data size	16bit	Data format	DEC
	Modbus address	2132, 2133	CANopen address	0x2542, 0x00
P5.67	Data size	16bit	Data format	DEC
	Modbus address	2134, 2135	CANopen address	0x2543, 0x00
P5.68	Data size	16bit	Data format	DEC
	Modbus address	2136, 2137	CANopen address	0x2544, 0x00

P5.69	PTP trigger buffer switch	Setting range	Default	Unit	Available mode	
		0-1	1	-	P	

After point trigger buffer is enabled, 8 buffer can be received consecutively by sequence.

P5.69	Data size	16bit	Data format	DEC
	Modbus address	2138, 2139	CANopen address	0x2545, 0x00

P5.70	Single-turn resolution of the disk	Setting range	Default	Unit	Available mode	
		$-(2^{31}-1)-(2^{31}-1)$	10000	pulse	P	

The resolution of the disk at single-turn driven by the motor.

P5.70	Data size	32bit	Data format	DEC
	Modbus address	2140, 2141	CANopen address	0x2546, 0x00

P5.71	Zero returning switch of disk	Setting range	Default	Unit	Available mode	
		0-3	0	-	P	

This function is used to set the mode for zero returning switch of the disk

P5.71	Data size	16bit	Data format	DEC
	Modbus address	2142, 2143	CANopen address	0x2547, 0x00

P5.72	Multi-turn mode	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

After enabling this function, the counting number of multi-turn encoder will change from 16-bit to 32-bit. Generally, the multi-turn encoder can only count to  $2^{16}$  turns.

P5.72	Data size	16bit	Data format	DEC
	Modbus address	2144, 2145	CANopen address	0x2548, 0x00

P5.73	Digital trigger mode of PTP	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

Setting value	Instruction
0	Binary input + trigger terminal mode
1	Single terminal trigger mode (support 7-step point only)

P5.73	Data size	16bit	Data format	DEC
	Modbus address	2146, 2147	CANopen address	0x2549, 0x00

P5.74	Digital output mode of PTP	Setting range	Default	Unit	Available mode	
		0-4	0	-	P	

Setting value	Function
[0]	Output before PTP arrival
1	Output after PTP arrival
2	Single point output+output before PTP arrival
3	Single point output+output after PTP arrival
4	Single point output+output after PTP arrival (support the control word in absolute position only)

P5.74	Data size	16bit	Data format	DEC
	Modbus address	2148, 2149	CANopen address	0x254A, 0x00

P5.75	Interruption pause of the point	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

This parameter is used to enable the interruption pause function of the point. When it is set to 1, point operation will be paused.

P5.75	Data size	16bit	Data format	DEC
	Modbus address	2150, 2151	CANopen address	0x254B, 0x00

## 6.7 Application function (P6)

P6.00	Forward low JOG speed	Setting range	Default	Unit	Available mode	
		0-6000	5	r/min	P	

This parameter is used to set the speed of slow forward jogging which is triggered by forward jogging terminal and switching terminal of high-low jogging speed.

P6.00	Data size	16bit	Data format	DEC
	Modbus address	2200, 2201	CANopen address	0x2600, 0x00

P6.01	Reverse low JOG speed	Setting range	Default	Unit	Available mode	
		-6000-0	-5	r/min	P	

This parameter is used to set the speed of slow reverse jogging which is triggered by reverse jogging terminal and switching terminal of high-low jogging speed.

P6.01	Data size	16bit	Data format	DEC
	Modbus address	2202, 2203	CANopen address	0x2601, 0x00

P6.02 <sup>1</sup>	Position latch function switch	Setting range	Default	Unit	Available mode	
		0-1	0	-	P	

Position latch function switch can be set via this parameter. After this function is enabled, the position information will be saved in EEPROM after each terminal latch, however, too frequent saving operation may damage the EEPROM.

Setting value	Function
[0]	Disabled
1	Enabled

P6.02 <sup>1</sup>	Data size	16bit	Data format	DEC
	Modbus address	2204, 2205	CANopen address	0x2602, 0x00

P6.03	Position latch save mode	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		

Position latch save mode can be set via this parameter:

Setting value	Function
[0]	Do not save
1	Save

P6.03	Data size	16bit	Data format	DEC
	Modbus address	2206, 2207	CANopen address	0x2603, 0x00

P6.04	Forward high JOG speed	Setting range	Default	Unit	Available mode		
		0-6000	60	r/min	P		

This parameter is used to set the speed of fast forward jogging which is triggered by forward jogging terminal and switching terminal of high-low jogging speed.

P6.04	Data size	16bit	Data format	DEC
	Modbus address	2208, 2209	CANopen address	0x2604, 0x00

P6.05	Reverse high JOG speed	Setting range	Default	Unit	Available mode		
		-6000-0	-60	r/min	P		

This parameter is used to set the speed of fast reverse jogging which is triggered by reverse jogging terminal and switching terminal of high-low jogging speed.

P6.05	Data size	16bit	Data format	DEC
	Modbus address	2210, 2211	CANopen address	0x2605, 0x00

P6.06	Terminal JOG valid	Setting range	Default	Unit	Available mode		
		0-1	0	-	P		

This parameter is used to set terminal JOG function:

Setting value	Function
[0]	Invalid
1	Valid

P6.06	Data size	16bit	Data format	DEC
	Modbus address	2212, 2213	CANopen address	0x2606, 0x00

P6.20 <sup>1</sup>	Turret function switch	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
This parameter is used to set turret function switch:							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P6.20 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	2240, 2241	CANopen address	0x2614, 0x00			

P6.21	Turret number	Setting range	Default	Unit	Available mode		
		1–128	16	piece	P		
This parameter is used to set turret number.							
P6.21	Data size	16bit	Data format	DEC			
	Modbus address	2242, 2243	CANopen address	0x2615, 0x00			

P6.22	Turret pulse number per cycle	Setting range	Default	Unit	Available mode		
		$2-(2^{31}-1)$	10000	reference unit	P		
This parameter is used to set turret pulse number per cycle.							
P6.22	Data size	32bit	Data format	DEC			
	Modbus address	2244, 2245	CANopen address	0x2616, 0x00			

P6.23 <sup>1</sup>	Starting point of turret	Setting range	Default	Unit	Available mode		
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P		
This parameter is used to set starting point of turret.							
P6.23 <sup>1</sup>	Data size	32bit	Data format	DEC			
	Modbus address	2246, 2247	CANopen address	0x2617, 0x00			

P6.30 <sup>1</sup>	Gantry synchronization function switch	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
This parameter is used to set the gantry synchronization switch.							
		Setting value	Function				
		[0]	Disabled				
		1	Enabled				
P6.30 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	2260, 2261	CANopen address	0x261E, 0x00			

P6.31	Gantry synchronous speed control gain	Setting range	Default	Unit	Available mode		
		0.0–3276.7	0.0	Hz	P		
This parameter is used to set the gantry synchronous speed control gain.							
P6.31	Data size	16bit	Data format	DEC			
	Modbus address	2262, 2263	CANopen address	0x261F, 0x00			

P6.32	Gantry synchronous speed control integral	Setting range	Default	Unit	Available mode		
		0.1–1000.0	1000.0	ms	P		
This parameter is used to set the time constant of gantry synchronous speed control integral. Please note that when this parameter is set to 1000, it means integral action is invalid.							
P6.32	Data size	16bit	Data format	DEC			
	Modbus address	2264, 2265	CANopen address	0x2620, 0x00			
P6.33	Gantry synchronous position control gain	Setting range	Default	Unit	Available mode		
		0.0–3276.7	1000.0	Hz	P		
This parameter is used to set the gantry synchronous position control gain.							
P6.33	Data size	16bit	Data format	DEC			
	Modbus address	2266, 2267	CANopen address	0x2621, 0x00			
P6.34	Gantry synchronous compensation torque filter	Setting range	Default	Unit	Available mode		
		0.00–64.00	0.00	ms	P		
This parameter is used to set the time constant of gantry synchronous compensation torque filter.							
P6.34	Data size	16bit	Data format	DEC			
	Modbus address	2268, 2269	CANopen address	0x2622, 0x00			
P6.35	Gantry synchronous compensation speed filter	Setting range	Default	Unit	Available mode		
		0.00–64.00	0.00	ms	P		
This parameter is used to set the time constant of gantry synchronous compensation speed filter.							
P6.35	Data size	16bit	Data format	DEC			
	Modbus address	2270, 2271	CANopen address	0x2623, 0x00			
P6.36	Gantry synchronous control bandwidth ratio	Setting range	Default	Unit	Available mode		
		0.0–1000.0	0.0	%	P		
This parameter is used to set the gantry synchronous control bandwidth ratio: $\text{bandwidth ratio} = \text{servo bandwidth} / (\text{servo bandwidth} + \text{synchronous bandwidth})$ .							
P6.36	Data size	16bit	Data format	DEC			
	Modbus address	2272, 2273	CANopen address	0x2624, 0x00			
P6.37 <sup>1</sup>	Gantry synchronization master/slave selection	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
This parameter is used to set the gantry synchronization master/slave:							
		Setting value	Instruction				
		[0]	Slave				
		1	Master				
P6.37 <sup>1</sup>	Data size	16bit	Data format	DEC			
	Modbus address	2274, 2275	CANopen address	0x2625, 0x00			

P6.38	Gantry synchronization alignment retreat distance	Setting range	Default	Unit	Available mode		
		$-(2^{31}-2)-(2^{31}-2)$	10000	reference unit	P		
This function is used to set the gantry synchronization alignment retreat distance: the retreat distance of the servo after contacting two alignment sensors.							
P6.38	Data size	32bit	Data format	DEC			
	Modbus address	2276, 2277	CANopen address	0x2626, 0x00			

P6.39	Gantry synchronization alignment retreat speed	Setting range	Default	Unit	Available mode		
		1–200	60	r/min	P		
This function is used to set the gantry synchronization alignment retreat speed: the retreat speed of the servo after contacting two alignment sensors.							
P6.39	Data size	16bit	Data format	DEC			
	Modbus address	2278, 2279	CANopen address	0x2627, 0x00			

P6.40	Gantry synchronization alignment approaching speed	Setting range	Default	Unit	Available mode		
		1–60	5	r/min	P		
This parameter is used to set the gantry synchronization alignment approaching speed: the speed of servo in approaching alignment sensor again after contacting two alignment sensors.							
P6.40	Data size	16bit	Data format	DEC			
	Modbus address	2280, 2281	CANopen address	0x2628, 0x00			

P6.41	Gantry alignment direction	Setting range	Default	Unit	Available mode		
		0–1	0	-	P		
Gantry alignment direction can be set via this parameter:							
		Setting value	Instruction				
		[0]	Forward				
		1	Reverse				
P6.41	Data size	16bit	Data format	DEC			
	Modbus address	2282, 2283	CANopen address	0x2629, 0x00			

## 6.8 PTP (point-to-point) control (PtP0, PtP1, PtP2)

PtP0.00	00 <sup>th</sup> control word	Setting range	Default	Unit	Available mode		
		0–0x7FFFFFFF	0x00000000	-	P		
Description:							
	Bit	Name	Function				
	Bit0–3	MODE	PTP operation mode				
	Bit4–7	OPT	PTP attribute				
	Bit8–11	ACC	ACC/DEC time index				
	Bit12–15	SPD	Target speed index				
	Bit16–19	DLY	Delay time index				
	Bit20–23	CYL	Cycle number of current PTP execution				
	Bit24–30	JMP	Jump to the next PTP				

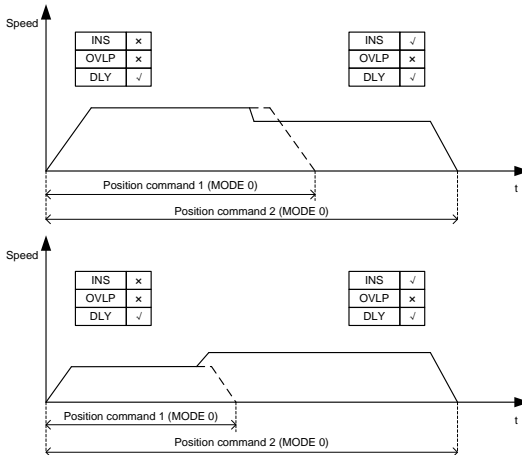

MODE:

MODE	Instruction
0	Stop after the execution of current PTP
1	Jump to the next PTP after the execution of current PTP
2	Stop after the cycle, the cycle is invalid if CMD=1
3	Jump to the next PTP after the cycle, the cycle is invalid if CMD=1

OPT:

Bit	Name	Function
Bit4	INS	Insert off, to stop the executing PTP or the PTP to be executed
Bit5	OVLP	Overlap, the PTP can be overlapped with the next PTP
Bit6-7	CMD	Position command, 0:incremental position, 1:absolute position

INS Instruction:

OVLP instruction:

Relation between INS and OVLP:

**Note:**

1. INS: current PTP has the authority of prior execution against the previous PTP;  
OVLP: current PTP has the authority to combine the next PTP for execution.
2. INS has higher priority against OVLP; if PTP 1 OVLP and PTP 2 INS are enabled at the same time, PTP 1 OVLP is invalid
3. Two PTPs which have opposite operation direction cannot be overlapped

PtP0.00	Data size	32bit	Data format	HEX
	Modbus address	3200, 3201	CANopen address	0x2B00, 0x00

PtP0.01	00 <sup>th</sup> position	Setting range	Default	Unit	Available mode	
		$-(2^{31}-1)-(2^{31}-1)$	0	reference unit	P	

This parameter is used to set the 00<sup>th</sup> position. CMD determines the current position command mode and P0.37 is invalid.

PtP0.01	Data size	32bit	Data format	DEC
	Modbus address	3202, 3203	CANopen address	0x2B01, 0x00

PtP0.02	01 <sup>st</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.04	02 <sup>nd</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.06	03 <sup>rd</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.08	04 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.10	05 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.12	06 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.14	07 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.16	08 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.18	09 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.20	10 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.22	11 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	

PtP0.24	12 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.26	13 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.28	14 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.30	15 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.32	16 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.34	17 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.36	18 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.38	19 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.40	20 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.42	21 <sup>st</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.44	22 <sup>nd</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.46	23 <sup>rd</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.48	24 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.50	25 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.52	26 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.54	27 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.56	28 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.58	29 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.60	30 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	
PtP0.62	31 <sup>st</sup> control word	Setting range	Default	Unit	Available mode	
		0-0x7FFFFFFF	0x00000000	-	P	

PtP0.64	32 <sup>nd</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.66	33 <sup>rd</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.68	34 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.70	35 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.72	36 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.74	37 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.76	38 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.78	39 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.80	40 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.82	41 <sup>st</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.84	42 <sup>nd</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.86	43 <sup>rd</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.88	44 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.90	45 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.92	46 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.94	47 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.96	48 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
PtP0.98	49 <sup>th</sup> control word	Setting range	Default	Unit	Available mode	
		0–0x7FFFFFFF	0x00000000	-	P	
This group of parameters are used to set the 01 <sup>st</sup> –49 <sup>th</sup> control word. Please refer to "PtP0.00" for detailed information.

## 6.9 State monitoring

### 6.9.1 User monitoring parameters (R0 group)

R0.00	Motor speed	Display range	Precision	Unit
		-9999.9~9999.9	0.1	r/min

Display the actual speed of the servo motor

**Note:** This parameter is processed with filtering when displaying.

R0.00	Data size	32bit	Data format	DEC
	Modbus address	4000, 4001	CANopen address	0x3000, 0x00

R0.01	Speed command	Display range	Precision	Unit
		-9999.9~9999.9	0.1	r/min

Display the current speed command of the servo motor.

**Note:** If the ACC/DEC time is enabled, the speed command is processed by the ACC/DEC time.

R0.01	Data size	32bit	Data format	DEC
	Modbus address	4002, 4003	CANopen address	0x3001, 0x00

R0.02	Feedback pulse accumulation	Display range	Precision	Unit
		$-(2^{63}-1)$ ~ $(2^{63}-1)$	1	reference unit

Accumulate and display the feedback accumulation pulse of the servo motor encoder. With sign and the unit is the user unit.

R0.02	Data size	64bit	Data format	DEC
	Modbus address	4004, 4005, 4006, 4007	CANopen address	0x3002, 0x00 0x3002, 0x01

R0.03	Command pulse accumulation	Display range	Precision	Unit
		$-(2^{63}-1)$ ~ $(2^{63}-1)$	1	reference unit

Accumulate and display the command pulse accumulation. With sign and the unit is the user unit.

R0.03	Data size	64bit	Data format	DEC
	Modbus address	4008, 4009, 4010, 4011	CANopen address	0x3003, 0x00 0x3003, 0x01

R0.04	Retention pulse	Display range	Precision	Unit
		$-(2^{31}-1)$ ~ $(2^{31}-1)$	1	reference unit

Display the number of retention pulses of the position deviation counter. The unit is the user unit.

R0.04	Data size	32bit	Data format	DEC
	Modbus address	4012, 4013	CANopen address	0x3004, 0x00

R0.05	Hybrid control deviation	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	reference unit

This parameter is used to display the tolerance between the encoder feedback position and the grating feedback position when fully-closed loop function is enabled. With sign, and the unit is the user unit.

R0.05	Data size	32bit	Data format	DEC
	Modbus address	4014, 4015	CANopen address	0x3005, 0x00

R0.06	Current torque	Display range	Precision	Unit
		-500.0-500.0	0.1	%

Display the actual torque at present. If the rated torque of servo motor is 100.0%, the actual value will be converted to percentage value to be displayed.

R0.06	Data size	16bit	Data format	DEC
	Modbus address	4016, 4017	CANopen address	0x3006, 0x00

R0.07	DC voltage of main circuit	Display range	Precision	Unit
		0.0-1000.0	0.1	V

Display the DC voltage of main circuit.

R0.07	Data size	16bit	Data format	DEC
	Modbus address	4018, 4019	CANopen address	0x3007, 0x00

R0.08	Voltage of control power	Display range	Precision	Unit
		0.0-1000.0	0.1	V

Display the DC voltage of control power.

R0.08	Data size	16bit	Data format	DEC
	Modbus address	4020, 4021	CANopen address	0x3008, 0x00

R0.09	Output voltage	Display range	Precision	Unit
		0.0-1000.0	0.1	Vrms

Display the valid value of the current output voltage.

R0.09	Data size	16bit	Data format	DEC
	Modbus address	4022, 4023	CANopen address	0x3009, 0x00

R0.10	Output current	Display range	Precision	Unit
		0.00-1000.00	0.01	Arms

Display the valid value of the output current.

R0.10	Data size	16bit	Data format	DEC
	Modbus address	4024, 4025	CANopen address	0x300A, 0x00

R0.11	Drive temperature	Display range	Precision	Unit
		-55.0–180.0	0.1	℃
Display the current temperature of the IGBT module.				
R0.11	Data size	16bit	Data format	DEC
	Modbus address	4026, 4027	CANopen address	0x300B, 0x00
R0.12	Torque limit	Display range	Precision	Unit
		-500.0–500.0	0.1	%
Display the actual torque limit at present. If the rated torque is 100.0%, the actual value will be converted to percentage value to be displayed.				
R0.12	Data size	16bit	Data format	DEC
	Modbus address	4028, 4029	CANopen address	0x300C, 0x00
R0.13	Encoder feedback value	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	pulse
Display the current encoder feedback value.				
R0.13	Data size	32bit	Data format	DEC
	Modbus address	4030, 4031	CANopen address	0x300D, 0x00
R0.14	Rotor relative to Z pulse position	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	pulse
Display the mechanical absolute position of the motor in one encoder cycle. The unit is encoder resolution.				
R0.14	Data size	32bit	Data format	DEC
	Modbus address	4032, 4033	CANopen address	0x300E, 0x00
R0.15	Inertia ratio of load	Display range	Precision	Unit
		0–10000	1	%
Display the predicted value of the ratio of rotational inertia of the servo motor to that of the load converted onto the servo motor's shaft.				
R0.15	Data size	16bit	Data format	DEC
	Modbus address	4034, 4035	CANopen address	0x300F, 0x00
R0.16	Output power	Display range	Precision	Unit
		-500.0–500.0	0.1	%
Display the output mechanical power of the drive. If the rated power of servo motor is 100.0%, the actual value will be converted to the percentage value to be displayed.				
<b>Note:</b> The negative value means the motor is in power generation state.				
R0.16	Data size	16bit	Data format	DEC
	Modbus address	4036, 4037	CANopen address	0x3010, 0x00

R0.17	Motor load ratio	Display range	Precision	Unit
		0.0–500.0	0.1	%
Display the actual motor load ratio. If the rated power is 100.0%, the actual value will be converted to the percentage value to be displayed.				
R0.17	Data size	16bit	Data format	DEC
	Modbus address	4038, 4039	CANopen address	0x3011, 0x00
R0.18	Molecule of actual electric gear ratio	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	-
Display the molecule coefficient of actual electric gear ratio				
R0.18	Data size	32bit	Data format	DEC
	Modbus address	4040, 4041	CANopen address	0x3012, 0x00
R0.19	Denominator of actual electric gear ratio	Display range	Precision	Unit
		$1-(2^{31}-1)$	1	-
Display the denominator coefficient of actual electric gear ratio				
R0.19	Data size	32bit	Data format	DEC
	Modbus address	4042, 4043	CANopen address	0x3013, 0x00
R0.20	Position command speed	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Display the speed value corresponds to the position command.				
R0.20	Data size	32bit	Data format	DEC
	Modbus address	4044, 4045	CANopen address	0x3014, 0x00
R0.21	Motor speed (filtering)	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Display the speed of the servo motor after filtering process.				
R0.21	Data size	32bit	Data format	DEC
	Modbus address	4046, 4047	CANopen address	0x3015, 0x00
R0.22	PTP state	Display range	Precision	Unit
		-1–4223	1	-
Display the execution state of PTP control: -1: no PTP control executed; 0-127: PTP number under executing; adding 4096 to the PTP number means the PTP execution is finished.				
R0.22	Data size	16bit	Data format	DEC
	Modbus address	4048, 4049	CANopen address	0x3016, 0x00
R0.23	Feedback of encoder absolute position	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	pulse
Display the feedback value of encoder absolute position, this value will change to 0 after zero-clearing operation.				

R0.23	Data size	32bit	Data format	DEC
	Modbus address	4050, 4051	CANopen address	0x3017, 0x00

R0.24	Encoder EEPROM data state	Display range	Precision	Unit
		0-3	-	-

Display the EEPROM state when EEPROM has no motor data or the data is not normal, the system will use the internal motor parameters.

Setting value	State
[0]	No EEPROM
1	EEPROM no data
2	EEPROM data error
3	EEPROM data normal

R0.24	Data size	16bit	Data format	DEC
	Modbus address	4052, 4053	CANopen address	0x3018, 0x00

R0.25	Circles of multi-turn encoder	Display range	Precision	Unit
		-32768-32767	0	-

Display the circles of multi-turn encoder.

R0.25	Data size	16bit	Data format	DEC
	Modbus address	4054, 4055	CANopen address	0x3019, 0x00

R0.26	Available encoder type	Display range	Precision	Unit
		0-6	-	-

It means the encoder type supported by hardware circuit.

Setting value	State
[3]	Optical encoder
5	Rotary transformer
Other values	(Reserved)

R0.26	Data size	16bit	Data format	DEC
	Modbus address	4056, 4057	CANopen address	0x301A, 0x00

R0.27	EtherCAT clock synchronous correction state	Display range	Precision	Unit
		0-1	-	-

Display whether the internal clock of drive is synchronized with DC Sync0 when EtherCAT communication synchronization mode adopts DC mode.

Setting value	State
[0]	Unsynchronized
1	Synchronized

R0.27	Data size	16bit	Data format	DEC
	Modbus address	4058, 4059	CANopen address	0x301B, 0x00

R0.28	State of CANopen state machine	Display range	Precision	Unit
		0-18	-	-
The current state of CANopen state machine in CAN communication and the state of CoE(CANopen over EtherCAT) state machine in EtherCAT communication				
		Setting value	Communication mode	State
		[0]	-	Invalid
		1	CAN	Init
		2		Pre-Op
		5		Stop
		8		Op(Operational)
		11	EtherCAT	Init
		12		Pre-Op
		14		Safe-Op
		18		Op(Operational)
R0.28	Data size	16bit	Data format	DEC
	Modbus address	4060, 4061	CANopen address	0x301C, 0x00
R0.29	Node of PROFIBUS-DP slave station	Display range	Precision	Unit
		0-99	-	-
Display the received node of PROFIBUS-DP slave station and correspond to the position of rotary switch.				
R0.29	Data size	16bit	Data format	DEC
	Modbus address	4062, 4063	CANopen address	0x301D, 0x00
R0.30	System state	Display range	Precision	Unit
		0-6	-	-
Display the system state.				
		Setting value	State	
		[0]	Initialization	
		1	The high voltage	
		2	Ready	
		3	Operation	
		4	Forced to stop	
		5	Fault	
		6	STO-In	
R0.30	Data size	16bit	Data format	DEC
	Modbus address	4064, 4065	CANopen address	0x301E, 0x00
R0.31	IGBT state	Display range	Precision	Unit
		0-1	-	-

Display the IGBT state.				
		Setting value	State	
		[0]	Off	
		1	On	
R0.31	Data size	16bit	Data format	DEC
	Modbus address	4066, 4067	CANopen address	0x301F, 0x00
R0.32	Current mode	Display range	Precision	Unit
		0-2	-	-
Display the current control mode.				
		Setting value	State	
		[0]	Position mode	
		1	Speed mode	
		2	Torque mode	
R0.32	Data size	16bit	Data format	DEC
	Modbus address	4068, 4069	CANopen address	0x3020, 0x00
R0.33	Power on time	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	s
Display the total power on time of the drive.				
R0.33	Data size	32bit	Data format	DEC
	Modbus address	4070, 4071	CANopen address	0x3021, 0x00
R0.34	Operation time	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	s
Display the total servo enabling operation time of the drive.				
R0.34	Data size	32bit	Data format	DEC
	Modbus address	4072, 4073	CANopen address	0x3022, 0x00
R0.35	DSP software version	Display range	Precision	Unit
		0.00-10.00	0.01	-
Display the DSP software version.				
R0.35	Data size	16bit	Data format	DEC
	Modbus address	4074, 4075	CANopen address	0x3023, 0x00
R0.36	FPGA software version	Display range	Precision	Unit
		0.00-10.00	0.01	-
Display the FPGA software version.				
R0.36	Data size	16bit	Data format	DEC
	Modbus address	4076, 4077	CANopen address	0x3024, 0x00

R0.37	Communication card software version	Display range	Precision	Unit
		0.00–10.00	0.01	-
Display the communication card software version.				
R0.37	Data size	16bit	Data format	DEC
	Modbus address	4078, 4079	CANopen address	0x3025, 0x00
R0.38	Drive serial No.1	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.1				
R0.38	Data size	16bit	Data format	DEC
	Modbus address	4080, 4081	CANopen address	0x3026, 0x00
R0.39	Drive serial No.2	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.2				
R0.39	Data size	16bit	Data format	DEC
	Modbus address	4082, 4083	CANopen address	0x3027, 0x00
R0.40	Drive serial No.3	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.3				
R0.40	Data size	16bit	Data format	DEC
	Modbus address	4084, 4085	CANopen address	0x3028, 0x00
R0.41	Drive serial No.4	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.4				
R0.41	Data size	16bit	Data format	DEC
	Modbus address	4086, 4087	CANopen address	0x3029, 0x00
R0.42	Drive serial No.5	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.5				
R0.42	Data size	16bit	Data format	DEC
	Modbus address	4088, 4089	CANopen address	0x302A, 0x00
R0.43	Drive serial No.6	Display range	Precision	Unit
		0–65535	1	-
Display the drive serial No.6				
R0.43	Data size	16bit	Data format	DEC
	Modbus address	4090, 4091	CANopen address	0x302B, 0x00

R0.44	Absolute position of linear encoder (2 <sup>nd</sup> encoder) in single circle	Display range	Precision	Unit
		0–(2 <sup>31</sup> -1)	1	pulse
Display the feedback value of absolute position of linear encoder (2 <sup>nd</sup> encoder) in single circle.				
R0.44	Data size	32bit	Data format	DEC
	Modbus address	4092, 4093	CANopen address	0x302C, 0x00
R0.45	Speed feedback of 2 <sup>nd</sup> encoder	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Display the actual speed of the servo motor.				
R0.45	Data size	32bit	Data format	DEC
	Modbus address	4094, 4095	CANopen address	0x302D, 0x00
R0.46	Observing speed of speed observer	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Detecting speed of speed observer.				
R0.46	Data size	32bit	Data format	DEC
	Modbus address	4096, 4097	CANopen address	0x302E, 0x00
R0.47	Feedback speed of speed observer	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Feedback speed of speed observer				
R0.47	Data size	32bit	Data format	DEC
	Modbus address	4098, 4099	CANopen address	0x302F, 0x00
R0.48	Observing disturbance torque via disturbance observer	Display range	Precision	Unit
		-1000.0–1000.0	0.1	%
Compensation torque of disturbance observer				
R0.48	Data size	32bit	Data format	DEC
	Modbus address	4100, 4101	CANopen address	0x3030, 0x00
R0.49	Compensation value of fully-closed-loop vibration suppressor	Display range	Precision	Unit
		-9999.9–9999.9	0.1	r/min
Compensation value of fully-closed-loop vibration suppressor				
R0.49	Data size	32bit	Data format	DEC
	Modbus address	4102, 4103	CANopen address	0x3031, 0x00
R0.51	Observe load inertia ratio in real time	Display range	Precision	Unit
		0–10000	1	%
Display load inertia ratio observed in real time.				
R0.51	Data size	16bit	Data format	DEC
	Modbus address	4106, 4107	CANopen address	0x3033, 0x00

R0.52	Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation (32-bit number)	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	pulse
Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation, 32-bit number, fast reading speed. If the data range exceeds 32-bit, use R0.57.				
R0.52	Data size	32bit	Data format	DEC
	Modbus address	4108, 4109	CANopen address	0x3034, 0x00
R0.53	Gantry synchronization position deviation	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	reference unit
Gantry synchronization position deviation.				
R0.53	Data size	32bit	Data format	DEC
	Modbus address	4110, 4111	CANopen address	0x3035, 0x00
R0.54	Linear encoder (2 <sup>nd</sup> encoder) position feedback value	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	pulse
Display the feedback position of linear encoder (2 <sup>nd</sup> encoder).				
R0.54	Data size	32bit	Data format	DEC
	Modbus address	4112, 4113	CANopen address	0x3036, 0x00
R0.55	Encoder circle number offset after clearing multi-turn position	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	-
Display the offset of encoder circles after zero clearing of multi-turn position.				
R0.55	Data size	32bit	Data format	DEC
	Modbus address	4114, 4115	CANopen address	0x3037, 0x00
R0.56	Encoder feedback value offset after clearing multi-turn position	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	pulse
Display the offset of encoder feedback value after zero clearing of multi-turn position.				
R0.56	Data size	32bit	Data format	DEC
	Modbus address	4116, 4117	CANopen address	0x3038, 0x00
R0.57	Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation (64-bit number)	Display range	Precision	Unit
		$-(2^{63}-1)-(2^{63}-1)$	1	pulse
Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation, 64-bit number				
R0.57	Data size	64bit	Data format	DEC
	Modbus address	4118, 4119, 4120, 4121	CANopen address	0x3039, 0x00 0x3039, 0x01
R0.58	Position inside the single-turn of the disk	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	pulse

Display the position inside the single-turn of the disk according to P5.70 [single-turn resolution of the disk].				
R0.58	Data size	32bit	Data format	DEC
	Modbus address	4122, 4123	CANopen address	0x303A, 0x00

R0.60	Temperature of medium-power motor	Display range	Precision	Unit
		-55~200	1	℃

Display present temperature of the medium-power motor with KTY84-130 temperature resistor. The temperature will be sampled only when P4.45 is set to a non-zero value.

R0.60	Data size	32bit	Data format	DEC
	Modbus address	4126, 4127	CANopen address	0x303C, 0x00

R0.99	Fault code	Display range	Precision	Unit
		-32768~32767	1	-

Display fault code, the thousands and hundreds are main fault codes, tens and ones are sub-fault codes.

R0.99	Data size	16bit	Data format	DEC
	Modbus address	4198, 4199	CANopen address	0x3063, 0x00

**6.9.2 IO monitoring parameters (R1)**

R1.00	Digital input state	Display range	Precision	Unit
		0x000~0x3FF	-	-
R1.01	Digital output state	Display range	Precision	Unit
		0x00~0x3F	-	-

This value is arranged in digital order and indicates the hex number of digital terminal state. When a terminal is in ON state, its corresponding bit is 1. When a terminal is in OFF state, its corresponding bit is 0. Then, this binary number is converted into a hexadecimal number. For example, 00000001011 is denoted as 0x00B.

The digital input state is denoted as 3-digit hexadecimal number. The arrangement sequence of the digital input is listed as below: (the digits not listed are filled with 0).

BIT9	BIT8	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1	BIT0
SI10	SI9	SI8	SI7	SI6	SI5	SI4	SI3	SI2	SI1

The digital output state is denoted as 2-digit hexadecimal number. The arrangement sequence of the digital output is listed as below: (the digits not listed are filled with 0)

BIT5	BIT4	BIT3	BIT2	BIT1	BIT0
SO6	SO5	SO4	SO3	SO2	SO1

R1.00	Data size	16bit	Data format	HEX
	Modbus address	4200, 4201	CANopen address	0x3100, 0x00
R1.01	Data size	16bit	Data format	HEX
	Modbus address	4202, 4203	CANopen address	0x3101, 0x00

R1.02	Original voltage of analog input 1	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the original voltage value of analog input channel 1				
R1.02	Data size	32bit	Data format	DEC
	Modbus address	4204, 4205	CANopen address	0x3102, 0x00
R1.03	Original voltage of analog input 2	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the original voltage value of analog input channel 2				
R1.03	Data size	32bit	Data format	DEC
	Modbus address	4206, 4207	CANopen address	0x3103, 0x00
R1.04	Original voltage of analog input 3	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the original voltage value of analog input channel 3				
R1.04	Data size	32bit	Data format	DEC
	Modbus address	4208, 4209	CANopen address	0x3104, 0x00
R1.05	Voltage of analog input 1	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the calibrated voltage value of analog input channel 1.				
R1.05	Data size	32bit	Data format	DEC
	Modbus address	4210, 4211	CANopen address	0x3105, 0x00
R1.06	Voltage of analog input 2	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the calibrated voltage value of analog input channel 2				
R1.06	Data size	32bit	Data format	DEC
	Modbus address	4212, 4213	CANopen address	0x3106, 0x00
R1.07	Voltage of analog input 3	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the calibrated voltage value of analog input channel 3				
R1.07	Data size	32bit	Data format	DEC
	Modbus address	4214, 4215	CANopen address	0x3107, 0x00
R1.08	Voltage of analog output 1	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the output voltage value after offset treatment of analog output channel 1				
R1.08	Data size	32bit	Data format	DEC
	Modbus address	4216, 4217	CANopen address	0x3108, 0x00

R1.09	Voltage of analog output 2	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the output voltage value after offset treatment of analog output channel 2				
R1.09	Data size	32bit	Data format	DEC
	Modbus address	4218, 4219	CANopen address	0x3109, 0x00
R1.10	Voltage of analog output 3	Display range	Precision	Unit
		-10.000–10.000	0.001	V
Display the output voltage value after offset treatment of analog output channel 3				
R1.10	Data size	32bit	Data format	DEC
	Modbus address	4220, 4221	CANopen address	0x310A, 0x00
R1.11	Cumulative value of pulse input	Display range	Precision	Unit
		$-(2^{31}-1)$ – $(2^{31}-1)$	1	reference unit
Accumulate and display the received pulse number from external pulse input.				
R1.11	Data size	32bit	Data format	DEC
	Modbus address	4222, 4223	CANopen address	0x310B, 0x00
R1.12	Pulse position command	Display range	Precision	Unit
		$-(2^{31}-1)$ – $(2^{31}-1)$	1	reference unit
Display the position command value in each pulse input detection cycle (0.125ms by default).				
R1.12	Data size	32bit	Data format	DEC
	Modbus address	4224, 4225	CANopen address	0x310C, 0x00
R1.13	Pulse speed command	Display range	Precision	Unit
		-10000.0–10000.0	0.1	r/min
Pulse speed command is the speed command corresponds to pulse position command.				
R1.13	Data size	32bit	Data format	DEC
	Modbus address	4226, 4227	CANopen address	0x310D, 0x00
R1.14	Analog compensation speed	Display range	Precision	Unit
		-10000.0–10000.0	0.1	r/min
Display analog compensation speed.				
R1.14	Data size	32bit	Data format	DEC
	Modbus address	4228, 4229	CANopen address	0x310E, 0x00
R1.15	Analog compensation torque	Display range	Precision	Unit
		-1000.0–1000.0	0.1	%
Display analog compensation torque				
R1.15	Data size	32bit	Data format	DEC
	Modbus address	4230, 4231	CANopen address	0x310F, 0x00

R1.16	DI capture encoder value	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	pulse
Display the encoder value captured by DI input.				
R1.16	Data size	32bit	Data format	DEC
	Modbus address	4232, 4233	CANopen address	0x3110, 0x00
R1.17	Display of drive state bit	Display range	Precision	Unit
		0-0xFFFFFFFF	1	-
Display the state bit of the drive: whether the state which corresponds to digital output function code 0x00-0x1f is valid.				
R1.17	Data size	32bit	Data format	DEC
	Modbus address	4234, 4235	CANopen address	0x3111, 0x00

### 6.9.3 Fault record parameter (R3)

R3.00	Fault code record	Display range	Precision	Unit
		-	-	-
Display the fault code when fault occurs. The default is the latest 1 fault record.				
R3.01	Power on time when fault occurs	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	h
Display the power on time when fault occurs.				
R3.02	Operation time when fault occurs	Display range	Precision	Unit
		$0-(2^{31}-1)$	1	h
Display the operation time when fault occurs.				
R3.03	Motor speed when fault occurs	Display range	Precision	Unit
		-20000-20000	1	r/min
Display the motor speed when fault occurs.				
R3.04	Speed command when fault occurs	Display range	Precision	Unit
		-20000-20000	1	r/min
Display the speed command when fault occurs.				
R3.05	Feedback pulse accumulation when fault occurs	Display range	Precision	Unit
		$-(2^{63}-1)-(2^{63}-1)$	1	reference unit
Display the feedback pulse accumulation when fault occurs.				

R3.06	Command pulse accumulation when fault occurs	Display range	Precision	Unit
		$-(2^{63}-1)-(2^{63}-1)$	1	reference unit
Display the command pulse accumulation when fault occurs.				

R3.07	Stranded pulse when fault occurs	Display range	Precision	Unit
		$-(2^{31}-1)-(2^{31}-1)$	1	reference unit
Display the stranded pulse when fault occurs.				

R3.08	Current torque when fault occurs	Display range	Precision	Unit
		-500.0–500.0	0.1	%
Display the current torque when fault occurs.				

R3.09	Main circuit DC voltage when fault occurs	Display range	Precision	Unit
		0.0–1000.0	0.1	V
Display the main circuit DC voltage when fault occurs.

		-	-	-
Display the fault record of the latest 10 fault.				

# 7 Commissioning

## 7.1 Operation instruction of inertia identification

Inertia identification is divided into online mode and offline mode.

### 1. Online inertia identification:

It is necessary to set following parameters when online inertia identification is selected:

- 1).P1.00; 2.P1.08. If P1.00 and P1.08 is larger than 0, the online mode is valid. If the inertia identification requirements are met, (1. the speed is larger than 150r/min;
- 2). the ACC time is longer than 20 ms;
- 3).the continuous acceleration range is more than 150r/min;
- 4). in 0.3 seconds, the speed can accelerate from 0r/min to 3000 r/min), the identification result will be updated to P1.01 and written into EEPROM in every 30 minutes automatically.

### 2. Offline inertia identification:

It is necessary to set following parameters when offline inertia identification is selected: 1.P1.05; 2.P1.06. 3. P1.07. The offline mode is available by the auxiliary function EF-JId of the panel operation. Refer to chapter 5.2.5.5 for the EF-JId procedure. The offline mode is not affected by P1.00 and P1.08.

Before executing the auxiliary function of EF-JId, set P1.05 according to the operation mode of the motor, set P1.06 according to the rotating cycle and set P1.07 according to the mechanical rigidity. The stronger the mechanical rigidity, the smaller the ACC/DEC time constant. Set P1.05 to 1 or 2. The smaller the value of P1.06 and P1.07 is, the more correct the identification result.

When executing the auxiliary function of EF-JId, please ensure P1.05 and P1.06 meet the needs; otherwise, there may be damage to the machine. Press Mode key can stop the execution.

If the execution EF-JId is finished normally, the identification result will be saved into P1.01 automatically. If there is fault, P1.01 will keep the result before identification. If it reports Er25-7, increase P1.06 or reduce P1.07.

The precision of the identification result will be affected if following occur: 1. Mechanical rigidity is low; 2. The load inertia change too fast; 3. There is a space; 4. The external disturbance changes too fast.

## 7.2 General method for parameters adjusting

There are two kinds of parameters adjustment:

1. Automatic adjustment setting of rigidity choice. The inertia ratio of the load can be counted manually. There are 32 rigidity sets for the gain setting of the loop.

- ◆ The adjustment needs to be carried out to the actual situation:

Mechanical structure	Rigidity set
Big handling, transmission equipment	0–13
Belt drive mechanism	5–16
Ball screw + Belt drive	5–16
Manipulator	15–22
Direct ball screw or rigid bodies	18–25

The bigger the set value, the faster the system response, however, noise and vibration may come along. Please make corresponding setting according to the action of mechanical device.

2. Manual adjustment. If the servo system has vibration or the control performance is not good, adjusting the parameters of speed loop and position loop to improve system performance or remove vibration.

Gain of the speed loop: mainly used to determine the response speed of the speed loop. Under the precondition the mechanical system does not vibrate, the larger the set value, the faster the response speed.

Speed loop integration time constant: the speed loop has an integrator which can reflect minor input. This integrator can delay the operation of the servo system. Therefore, when time constant increases, the response becomes slower, and the required positioning setting time is longer. When the load inertia is large or the mechanical system is likely to vibrate, the loop integration time parameter must be large enough to avoid the vibration of the mechanical system.

Torque command filter: in some cases the mechanical system may resonate, generating vibration noise in sharp tone. At this time filtering via notch filter must be performed to eliminate resonance.

Gain of the position loop: the response of the servo system is determined by the gain of the position loop. When the gain of the position loop is set to a high value, the response speed will increase and the time required for positioning will be shortened. If you want to set the gain of the position loop to a high value, the rigidity and natural frequency of the mechanical system must be very high.

Generally, the gain of the speed loop should be larger than the gain of the position loop whenever possible. When the position gain is much larger than the speed gain, the system may overshoot under the action of the step signal, which will seriously damage the system performance. Parameters of the system always mutually limit each other. If the gain of the position loop increases only, the command outputted by the position loop may become unstable. This may cause the reaction of the servo system to become unstable. In general cases, we can adjust the system by referring to the follow procedures:

- 1) First set the gain of the position loop to a low value, then, under the precondition that abnormal sound and vibration are not generated, gradually increase the gain of the speed loop to the maximum.
- 2) Gradually decrease the gain of the speed loop while increasing the gain of the position loop. Under the precondition that the whole response is free from overshoot and vibration, set the gain of the position loop to the maximum.

3) Speed loop integral time constant depends on the length of the positioning time. Please decrease this value as small as possible under the precondition that the mechanical system does not vibrate.

4) After that, finely adjust the gain of the position loop, speed loop and the integration time constant to find their optimal values.

Hereunder we illustrate several typical cases (in each case, only one parameter is changed relative to a case when the parameters are appropriate):

◆ Parameters are appropriate

In this case the parameters are set relatively appropriate. The motor speed can closely follow the position command, the speed has basically no overshoot, and the positioning time is relatively short.

◆ Speed loop integral time constant is relatively small

The speed loop of the servo drive must have high reaction speed. When the speed fluctuates, it indicates that the stability of the speed loop is damaged due to the shorting integration time of the speed loop. This causes the servo motor to run unstably at fluctuating speed.

◆ Speed loop integration time constant is relatively large

In this case, there is no apparent difference with the case when the parameters are appropriate. The influence of the speed loop integration on the speed follow-up position command is not very high, but too large speed loop integration time will delay the reaction time of the speed loop.

◆ Gain of the speed loop is relatively high

In this case, the motor speed will fluctuate. The influence is the same as the case when the speed loop integration time is too short. Both of them must keep coordinated. While increasing the gain of the speed loop, the speed loop integration time must also be increased. Otherwise the servo system will oscillate.

◆ Gain of the speed loop is too low

Decreasing the gain of the speed loop will cause fluctuation of the motor speed to fluctuate. By comparing with the case when the speed gain is too high we can know that the fluctuation frequency of the motor speed is lower in this case which fully indicates that increasing the gain of the speed loop can heighten the operating frequency of the system, improve the quick response performance of the system, and effectively overcome the influence of the interference.

◆ Gain of the position loop is excessively low

In the servo system, the operating frequency of the position loop is much lower than the speed loop. When the gain of the position loop is too low, the system is difficult to eliminate the position deviation formed during speed response. This can cause prolongation of the time interval of the motor speed follow-up position command.

◆ Gain of the position loop is excessively high

In the position servo system, the gain of the position loop also affects the stability. At this time, as the gain of the position loop is excessively high, it makes the motor speed to fluctuate. Additionally, comparing with the case when the gain of the position loop is too low we can know that the pure time delay of the response to the position command of the motor speed is decreased.

◆ Gain of the position loop is too low

When we adjust the gain of the position loop to a low value, the motor speed follow-up position command represents obvious lag and the positioning time is prolonged largely. The high accuracy and high response performance of the positioning system are seriously affected.

7.2.1 Gain adjustment of position mode

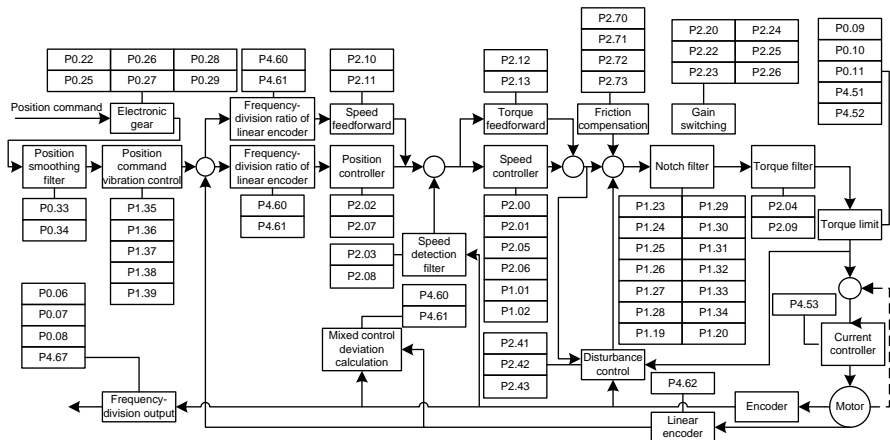

◆ Semi-closed loop function

The position control diagram of the SV-DA200 series servo drive is shown in the figure below. The gain parameters that can be adjusted in the position mode are marked out on the block diagram.

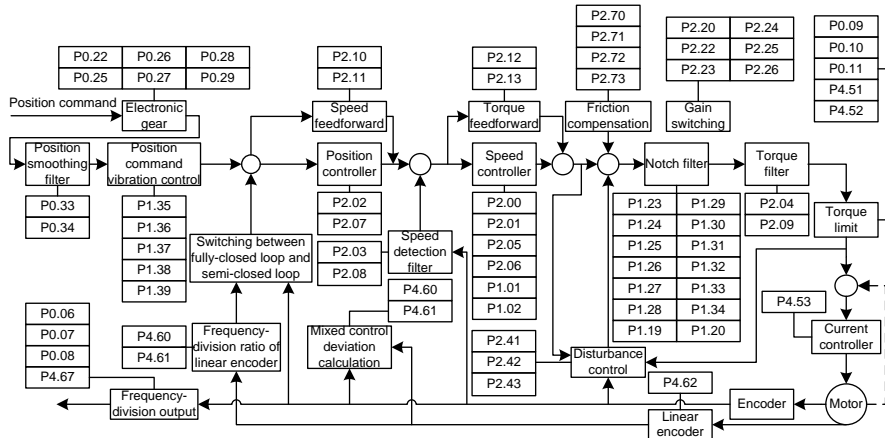

◆ Fully-closed loop function

When P0.38 [fully-closed loop enable] of SV-DA200 series servo drive is set to 1, the control diagram is shown as below. The gain parameters that can be adjusted are marked out in the diagram.

When P0.38 [fully-closed loop enable] of SV-DA200 series servo drive is set to 2, the control diagram is shown below. The gain parameters that can be adjusted are marked out in the diagram.

The general procedures for parameter adjustment in the position mode are:

#### 1) Initial setting of the parameters

The defaults of the parameters can be recovered by the default parameter recovering operation (see chapter 5.2.5.3 for details).

#### 2) Adjustment of the gain of the position loop

When the servo motor is running with default parameters, if the system oscillation occurs with buzz, the position gain (P2.02, P2.07) should be adjusted smaller. If the system rigidity is relatively small, the position gain should be adjusted larger.

#### 3) Adjustment of the position smoothing filter

During position control, if the position pulse commands input frequency varies largely, it may be caused by a larger impulse. At this time the position smoothing filters time constant (P0.33) or position command FIR filter (P0.34) should be adjusted to moderate the impulse.

#### 4) Adjustment of the electronic gear

If the pulse transmission frequency of the pulse generator is restricted, or the transmission frequency does not meet the mechanical requirements, we can change the pulse input frequency by adjusting the value of the electronic gear parameters (P0.25, P0.26, P0.27, P0.28 and P0.29) to meet the requirements for position control.

#### 5) Adjustment of position feed-forward

In the case the retention pulse is large or fault-free follow-up is required, we can improve the position follow-up performance by adjusting the speed feed-forward gain parameter (P2.10) and speed feed-forward gain filter parameter (P2.11). However, it should be noted that if the speed feed-forward

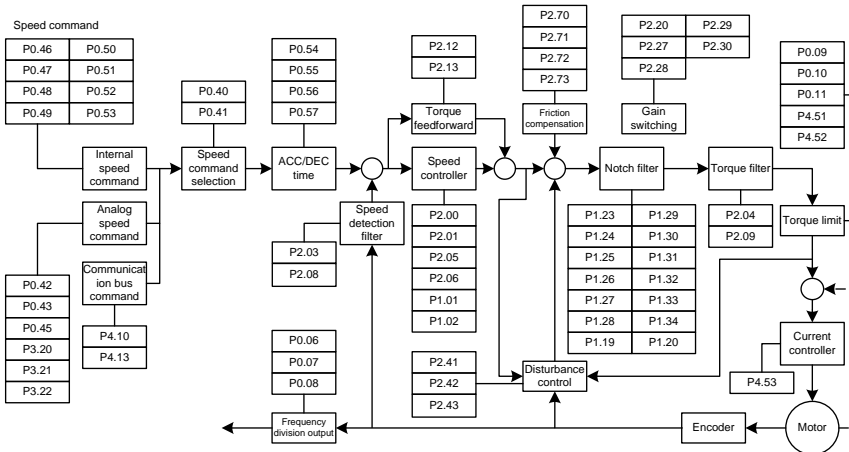

gain is too large, it may cause system oscillation.

#### 6) Frequency division of the feedback pulse output

If the feedback pulse needs to be outputted, the frequency division coefficient of pulse output (P0.06, P0.07) can be used to change the frequency of the output pulse.

### 7.2.2 Gain adjustment of speed mode

The speed control block diagram of the SV-DA200 series servo drive is shown in the figure below. The gain parameters that can be adjusted in the speed mode are marked on the block diagram.

The general procedures for parameter adjustment in the speed mode are:

#### 1) Initial setting of the parameters

The defaults of the parameters can be recovered by the default parameter recovering operation (see chapter 5.2.5.3 for details).

#### 2) Adjustment of the gain of the speed loop

When the servo motor is running with default parameters, if the system oscillation occurs with buzz, the speed gain (P2.00, P2.05) should be adjusted smaller. If the system rigidity is relatively small or the speed fluctuates largely, the speed gain should be adjusted larger.

#### 3) Adjustment of the speed integration time constant

When the gain of the speed loop is increased, the speed integration time constant (P2.01, P2.06) should be increased at the same time. Similarly, when the gain of the speed loop is decreased, the speed integration time constant should be decreased at the same time.

#### 4) Adjustment of the ACC/DEC time

If the speed varies violently during starting, it may cause large impulse or even overcurrent. At this time we adjust the ACC time (P0.54) to smoothen the speed rise. Similarly, we can adjust the DEC

time (P0.55) to smoothen the speed fall during stopping.

#### 5) S curve ACC/DEC adjustment

If the requirement for smooth variation of speed cannot be met by adjusting the ACC/DEC time, we can adjust the S curve ACC/DEC time (P0.56, P0.57) to make it change more smoothly.

#### 6) Adjustment of the speed smoothing filter

In case where the analog quantity serves as “speed command” input, users can adjust the analog input filter to make the speed change smoothly.

#### 7) Adjustment of torque feed-forward

If the speed follow-up performance is still poor after above parameter adjustment, we can adjust the torque feed-forward gain (P2.12) and torque forward feedback filter time (P2.13) to improve the speed follow-up performance. It should be noted however that too large torque feed-forward gain may affect the stability of the system.

#### 8) Adjustment of speed filter

The performance of the speed loop can be improved by adjusting P2.04/P2.09 and P2.03/P2.08.

#### 9) Adjustment of notch filtering

Refer to chapter 7.3.

#### 10) Frequency division of the feedback pulse output

If the feedback pulse of the encoder needs to be outputted, the frequency division output coefficient (P0.06, P0.07) can be used to change the frequency of the output pulse.

#### 11) Interference control adjustment

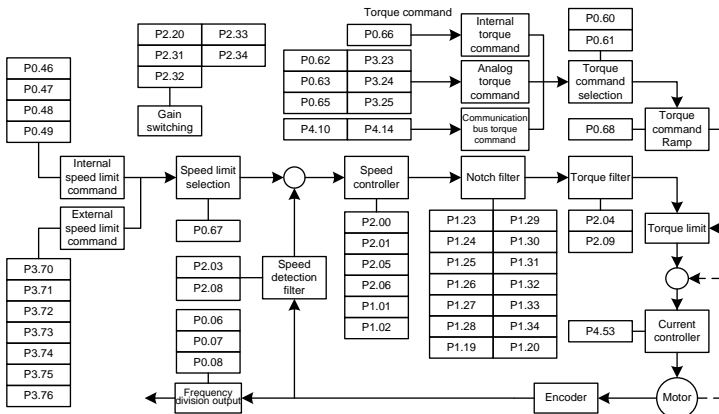

If the gain is small, the load changes or there is sudden external interference torque, users can adjust P2.42 and P2.43 of the disturbance observer to reduce the interference and improve the speed loop performance.

#### 12) Friction compensation adjustment

If the following performance of the motor is bad during the direction changing of forward and reverse rotation, it can adjust P2.71 and P2.72 to improve the speed loop performance during commutation.

### 7.2.3 Adjustment of the gain of the torque loop

The torque control block diagram of the SV-DA200 series servo drive is shown in the figure below. The gain parameters that can be adjusted in the torque mode are marked out on the block diagram.

The general procedures for parameter adjustment in the torque mode are:

1) Initial setting of the parameters

The defaults of the parameters can be recovered by the default parameter recovering operation (see chapter 5.2.5.3 for details).

2) Adjustment of the torque smoothing filter

In case the analog quantity serves as “torque command” input, users can adjust the analog input filter to make the torque change smoothly.

3) Frequency division of the feedback pulse output

If the feedback pulse of the encoder needs to be outputted, the frequency division coefficient of pulse output can be used to change the frequency of the output pulse.

### 7.3 Suppression of mechanical resonance

The mechanical system has a certain resonant frequency. If the response speed of the servo is improved, the system may resonate (oscillation and abnormal noise) near the mechanical resonant frequency. The resonance of the mechanical system can be effectively suppressed by setting the parameters of the notch filters.

The notch filters achieve the goal of suppressing mechanical resonance by decreasing the gain of certain frequency. We can set the frequency to be suppressed as well as the suppression extent with relevant parameters.

This servo drive is equipped with four notch filters which can be set by 1<sup>st</sup> notch filter parameter (P1.23, P1.24, P1.25), 2<sup>nd</sup> notch filter parameter (P1.26, P1.27, P1.28), 3<sup>rd</sup> notch filter parameter (P1.29, P1.30, P1.31) and 4<sup>th</sup> notch filter parameter (P1.32, P1.33, P1.34). 1<sup>st</sup> and 2<sup>nd</sup> notch filter parameters need to be set manually; 3<sup>rd</sup> and 4<sup>th</sup> notch filter parameters can be set by online self-adaption. The position of notch filter in speed loop is shown in the figure in chapter 7.2.2. The setup of notch filter is shown in the diagram below.

**Note:**

The notch filter is the lag factor for the servo system, so, if the center frequency of control width is large, the vibration may be strengthened. It is recommended to increase the width unit it meets the requirements.

The relationship between the Q value, width and depth is as below:

- Q value of the notch filter=Center frequency of the notch wave /Width of the notch wave;
- If the width of the notch is 0, the width of the filter is the deviation between two frequencies when the power of the center frequency drops to -3dB;
- The depth of the filter means the ratio of input and output, and its power spectrum strength attenuates by  $20\log(P1.25\%, P1.28\%, P1.31\%, P1.34\%)$  dB.

## 7.4 Gain switching function

Gain switching operation is performed through internal data or external signal:

- 1) Can switch to lower gain to suppress vibration in the state when the motor is stopped;
- 2) Can switch to higher gain to shorten the positioning time in the state the motor is stop;
- 3) Can switch to high gain to obtain better command follow-up performance in the state when the motor is running.
- 4) Can switch between different gain settings through external signal according to the conditions of load, equipment and so on.

●Position control and fully-closed loop control (●: valid, —: invalid)

Condition setting of gain switching			Parameters setting of position control and fully-closed loop control mode		
P2.22	Switch to 2 <sup>nd</sup> gain	Figure	Delay time* <sup>1</sup>	Level	Lag* <sup>2</sup>
			P2.23	P2.24	P2.25

3	Torque command	1	●	●(0.1%)	●(0.1%)

\*<sup>1</sup> Delay time (P2.23, P2.28, P2.32) is only valid when 2<sup>nd</sup> gain to 1<sup>st</sup> gain

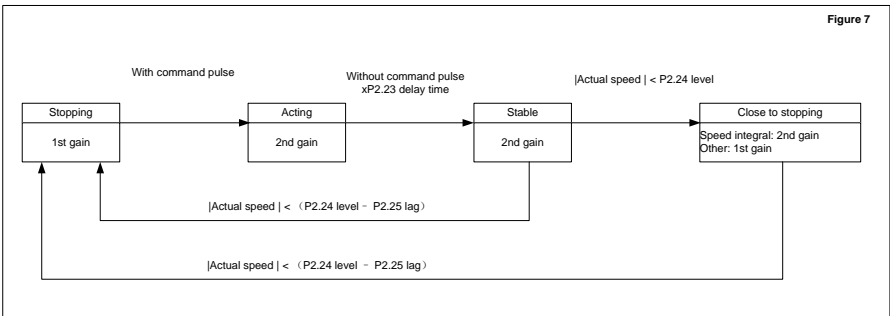

\*<sup>2</sup> The definition of lag (P2.25, P2.30, P2.34) is shown as the figure below.

\*<sup>3</sup> The encoder and external linear encoder can be designated in the control mode.

\*4 If 10r/min speed changing in 1s, the setting value is 1.

\*5 If P2.22=9, the delay time, level and lag have different meaning (see figure 7).

Note: The offset of gain switching sequence caused by lag(P2.25, P2.30, P2.34) is not reflected in above graphs.

# 8 Communication

## 8.1 Overview

SV-DA200 servo drives provide RS485, CANopen and PROFIBUS-DP communication interface. Asynchronous serial half-duplex communication between 31 servo drives and NC or PLC is available through the RS485 interface; asynchronous serial half-duplex communication between 127 servo drives and NC or PLC is available through the CAN interface; asynchronous serial half-duplex communication between 100 servo drives and NC or PLC is available through the PROFIBUS-DP interface.

- ◆ Read/write the function parameters of the servo drives
- ◆ Monitor the operating state of the servo drives
- ◆ Form a multi-axis control system

There are three kinds of communication interface USB, CANopen and Ethernet between the servo drive and PC. And the PC has functions of parameter calibration, condition monitoring and data access to the drive. External communication card is needed for Ethernet communication.

## 8.2 RS485 communication protocol

The SV-DA200 provide RS485 communication interface. It adopts international standard ModBus communication protocol to perform master-slave communication. The user can realize centralized control through PC/PLC, upper control PC, etc. (set the control command, running frequency of the inverter, modify relevant function codes, monitor and control the operating state and fault information of the inverter and so on) to adapt specific application requirements.

### 8.2.1 Protocol content

The Modbus serial communication protocol defines the frame content and usage format in asynchronous transmission which includes: master polling, and the format of the broadcast frame and the slave answering frame. The frame of the master includes: the slave address (or the broadcast frame), commands, digit and error checkout. The slave answering also applies the same structure: action confirmation, digit returning and error checkout. If there is a mistake during the frame receiving of the slave or the slave cannot finish the action which the master requires, it will respond an error frame to the master as a response.

### 8.2.2 Protocol instructions

The communication protocol of the SV-DA200 series servo drives is an asynchronous serial Master-Slave communication protocol. The master is the only device in the network to build up the protocol (named as inquiry/command), while the other devices (the slaves) can respond to or do action to the inquiry/command of the master through providing digits. The master in this manual means PC, industrial control devices and PLC. The slaves mean the servo drives and other control devices with the same communication protocol. The master can communicate with a certain slave, as well as, send broadcast message to all slaves. For the separately-visiting inquiry/command of the master, the slave should return a message as the response. While for the broadcast message, the

salve needs not to do so.

### 8.2.3 Communication frame structure

Modbus protocol supports RTU mode only. The user can set serial communication parameters, such as, the baud rate and the checkout means.

#### 8.2.3.1 RTU mode

Each 8bit bytes in the message frame contains two 4bit hex characters.

Table 8-1: The message frame in RTU mode

The start bit	Device address	Command code	Data	LRC checkout	The tailed
T1-T2-T3-T4	8Bit	8Bit	n 8Bit(s)	16Bit	T1-T2-T3-T4

The Modbus minimum idle time between frames should be no less than 3.5 bytes. The network device is detecting, even during the interval time, the network bus. When the first field (the address field) is received, the corresponding device decodes next transmitting character. When the interval time is at least 3.5 byte, the message ends.

The whole message frame in RTU mode is a continuous transmitting flow. If there is an interval time (more than 1.5 bytes) before the completion of the frame, the receiving device will renew the uncompleted message and suppose the next byte as the address field of the new message. As such, if the new message follows the previous one within the interval time of 3.5 bytes, the receiving device will deal with it as the same with the previous message. If these two phenomena all happen during the transmission, the CRC will generate a fault message to respond to the sending devices.

### 8.2.4 Command code and the communication data instructions

#### 8.2.4.1 Command code: 03H

Function: read N words (can read no more than 16 words continuously).

For example, the servo drive with the salve address of 01H, if its starting address is 03F2H, read 2 words continuously, and then the structure of the frame is:

Table 8-2 The master device request command

START	T1-T2-T3-T4 (transmission time of 3.5 bytes)
ADDR	01H
CMD	03H
High bit of start address	03H
Low bit of start address	F2H
High bit of data number	00H
Low bit of data number	02H
Low bit of CRC CHK	65H
High bit of CRC CHK	BCH
END	T1-T2-T3-T4 (transmission time of 3.5 bytes)

Table 8-3 The slave device reply

START	T1-T2-T3-T4 (transmission time of 3.5 bytes)
ADDR	01H
CMD	03H
Byte number	04H
Higher bit of 03F2H	00H
Low bit of 03F2H	C8H
High bit of 03F3H	00H
Low bit of 03F3H	00H
Low bit of CRC CHK	7BH
High bit of CRC CHK	CDH
END	T1-T2-T3-T4 (transmission time of 3.5 bytes)

**8.2.4.2 Command code: 10H**

Function: write N words ( $N \geq 2$ )

For example, write 300(0000012CH) into address 03F2H, slave device address 01H. And then the structure of the frame is:

Table 8-4 The master device request command

START	T1-T2-T3-T4 (transmission time of 3.5 bytes)
ADDR	01H
CMD	10H
High bit of data address	03H
Low bit of data address	F2H
High bit of data number	00H
Low bit of data number	02H
Byte number	04H
High bit of 1 <sup>st</sup> word of data content	01H
Low bit of 1 <sup>st</sup> word of data content	2CH
High bit of 2 <sup>nd</sup> word of data content	00H
Low bit of 2 <sup>nd</sup> word of data content	00H
Low bit of CRC CHK	A9H
High bit of CRC CHK	F7H
END	T1-T2-T3-T4 (transmission time of 3.5 bytes)

Table 8-5 The slave device reply command

START	T1-T2-T3-T4 (transmission time of 3.5 bytes)
ADDR	01H
CMD	10H

High bit of start address	03H
Low bit of start address	F2H
High bit of data number	00H
Low bit of data number	02H
Low bit of CRC CHK	E0H
High bit of CRC CHK	7FH
END	T1-T2-T3-T4 (transmission time of 3.5 bytes)

### 8.2.5 Error checkout of the communication frame

The error checkout of the frame can be divided into two parts: the bit checkout of the byte and the whole data checkout of the frame (CRC check or LRC check).

#### 8.2.5.1 Bit checkout of the byte

The user can select different bit checkouts or non-checkout, which impacts the check bit setting of each byte.

The definition of even checkout: add an even check bit before the data transmission to illustrate the number of "1" in the data transmission is odd number or even number. When it is even, the check byte is "0", otherwise, the check byte is "1". This method is used to stabilize the parity of the data.

The definition of odd checkout: add an odd check bit before the data transmission to illustrate the number of "1" in the data transmission is odd number or even number. When it is odd, the check byte is "0", otherwise, the check byte is "1". This method is used to stabilize the parity of the data.

For example, when transmitting "11001110", there are five "1" in the data. If the even checkout is applied, the even check bit is "1"; if the odd checkout is applied; the odd check bit is "0". The even and odd check bit is calculated on the check bit position of the frame. And the receiving devices also carry out even and odd checkout. If the parity of the receiving data is different from the setting value, there is an error in the communication.

#### 8.2.5.2 CRC check

The checkout uses RTU frame format. The frame includes the frame error detection field which is based on the CRC calculation method. The CRC field is two bytes, including 16-bit binary values. It is added into the frame after calculated by transmitting device. The receiving device recalculates the CRC of the received frame and compares them with the value in the received CRC field. If the two CRC values are different, there is an error in the communication.

During CRC, 0\*FFFF will be stored. And then, deal with the continuous 6-above bytes in the frame and the value in the register. Only the 8Bit data in every character is effective to CRC, while the start bit, the tailed and the odd and even check bit is ineffective.

During the generating CRC, each 8-bit is XOR with the register content, the result shifts toward the min. effective bit while the max. effective bit is filled with 0. LSB is extracted for detection. If LSB is 1, the register is XOR with the preset value independently, if LSB is 0, no action. The whole process will be repeated 8 times. After the last bit (8<sup>th</sup> bit) completes, the next 8-bit byte will be XOR with the

current value of register independently. Finally, the value in the register is the CRC value after all bytes in the frame are executed.

The calculation of CRC applies the international standard CRC checkout principles. When the user is editing CRC calculation, he can refer to the relative standard CRC calculation to write the required CRC calculation program.

### 8.2.6 Fault Responses

The slave uses functional code fields and fault addresses to indicate it is a normal response or some error occurs (named as objection response). For normal responses, the slave shows corresponding function codes, digital address or sub-function codes as the response. For objection responses, the slave returns a code which equals the normal code, but the first byte is logic 1.

**Example:** When the master sends a message to the slave, requiring it to read a group of address data of servo device function codes, there will be following function codes:

0 0 0 0 0 1 1 (Hex 03H)

For normal responses, the slave responds the same codes, while for objection responses, it will return:

1 0 0 0 0 1 1 (Hex 83H)

Besides the function codes modification for the objection fault, the slave will respond a byte of abnormal code which defines the error reason.

When the master receives the response for the objection, in a typical processing, it will send the message again or modify the corresponding order.

Table 8-6 Meaning of error code

Modbus abnormal code		
Code	Name	Meaning
01H	Illegal function	Receiving function codes from the upper devices is not allowable. This may because these function codes can only be applied to new devices or the slave device is dealing with this requirement in a wrong situation.
02H	Illegal data address	For servo drives, the required data address is not allowed; especially the mix of the register address and transmitting byte numbers is invalid.
03H	Illegal data value	The data value received is beyond the range of address parameters, leading the parameter modification invalid.
11H	Check error	In the frame message sent by the upper devices, if the CRC check bit of RTU format or the LRC check bit of ASCII format is different from the check number calculated by below device, check error will be reported.

## 8.3 CANopen communication protocol

### 8.3.1 CANopen instructions

CANopen is the high level communication protocol on the control area network, includes the applications communication agreement and equipment sub-agreement in embedded system. The basic CANopen devices and sub communication protocols are in CAN in Automation (CiA) draft

standard 301. And there are some expansion for some sub-agreement based on CiA 301, for example, CiA 402 for dynamic control.

### 8.3.2 CANopen hardware configuration

Refer to chapter 3.6 for the definitions and functions of pins of CAN communication terminals (CN3). See the table below:

Baud rate	Communication length
1Mbit/s	25m
500kbit/s(default)	100m
250kbit/s	250m
125kbit/s	500m
50kbit/s	1000m
20kbit/s	2500m

**Note:**

1. All CANL and CANH pins of the slave station can be connected directly with series connection other than y connection.
2. The resistance of 120 ohms is needed between the master station end and the last node.
3. In order to avoid interference, CAN cable is shielded twisted-pair cable.
4. The longer connection needs higher drive ability of the CAN chip.

### 8.3.3 CANopen software configuration

Configure following three parameters before the application of CANopen:

1. Set P0.03 through LED panel or ServoPlover software to 7 [CANopen mode];
2. Set P4.02 through LED panel or ServoPlover software (0:1Mbps; 1:500kbps; 2:250kbps; 3:125kbps; 4:50kbps; 5:20kbps);
3. Set P4.05 through LED panel or ServoPlover software(range:1–127).

**Note:**

1. Above three parameters are valid after restarting, so it is necessary to repower again or reset the drive;
2. The node number of slave station cannot be the same as the node number of master station and other slave station (CNC or PLC);
3. Synchronous signal is generated by the master station or be configured by the slave station. The unit of synchronous communication cycle is 1us and the minimum unit of SV-DA200 is 1000 μs (1ms);
4. 0x1017 parameters is needed to be configured when the main station needs the slave station to send a heartbeat message, the Unit is 1ms;
5. The drive will shut down automatically to ensure safety when CANopen state machine exits from OP state.

### 8.3.4 CANopen functions

SV-DA200 servo drive is the standard slave station of CANopen and support some parameters of 301 standard protocol and 402 dynamic control protocol.

The basic protocol supporting CANopen: NMT, SYNC, SDO, PDO, EMCY.

The pre-definition collection includes 4 receiving PDO (Receive-PDO), 4 sending PDO

(Transmit-PDO), 1 SDO(occupying 2 CAN-ID), 1 emergency target and 1 node error control (Node-Error-Control)ID, and it also supports NMT-Module-Control service and SYNC signal.

Table 8-7 Specifications of CiA 402 protocol

Er24-3	PROFIBUS-DP fault–PZD Configuration parameter does not exist	8100-1803h
Er24-4	PROFIBUS-DP fault–PZD Configuration parameter attributes do not match	8100-1804h
Er25-4	Application fault–Encoder offset angle test overtime	FF01-1904h
Er25-5	Application fault–Encoder offset angle test failure	FF01-1905h
Er25-6	Application fault–Offside of homing	FF01-1906h
Er25-7	Application fault–Inertia identification failure	FF01-1907h
Er26-0	CANopen fault–CANopen disconnection	FF01-1A00h
Er26-1	CANopen fault–SDO index does not exist	FF01-1A01h
Er26-2	CANopen fault–SDO sub index does not exist	FF01-1A02h
Er26-3	CANopen fault–SDO data length error	FF01-1A03h
Er26-4	CANopen fault–SDO write data beyond the range	FF01-1A04h
Er26-5	CANopen fault–Read-only and non-modifiable	FF01-1A05h
Er26-6	CANopen fault–PDO mapping length error	FF01-1A06h
Er26-7	CANopen fault–PDO mapping data does not exist	FF01-1A07h
Er26-8	CANopen fault–PDO is not allowed to be changed during operating	FF01-1A08h
Er26-9	CANopen fault–PDO mapping is not allowed	FF01-1A09h
Er26-a	CANopen fault–Sync signal is too fast	FF01-1A0Ah
Er26-b	CANopen fault–Receiving fault	FF01-1A0Bh
Er26-c	CANopen fault–Sending fault	FF01-1A0Ch
Er26-d	CANopen fault–Sync signal repeat	FF01-1A0Dh

Display	Fault name	32-bit fault code(16-bit Error Code+16-bit additional message)
Er26-e	CANopen fault–Bus load rate is too high	FF01-1A0Eh
Er26-f	CANopen fault–Parameter modification state error	FF01-1A0Fh

## 8.4 PROFIBUS-DP communication protocol

### 8.4.1 Brief introduction to PROFIBUS-DP protocol

PROFIBUS is a fieldbus standard used in automation technology and promoted in 1987 by Germany's Siemens and other 14 companies and five research institutions. PROFIBUS is short for PROcess Field BUS.

PROFIBUS DP is used in factory automation application, it can control many sensors and actuators by a central controller and master the state of each module by the standard or diagnostic function.

### 8.4.2 PROFIBUS-DP hardware configuration

The front side of PROFIBUS-DP communication card is as the figure below:

Name	Meaning
S2	PROFIBUS-DP communication terminal resistance selection switch: Press down: terminal resistance valid Hold on: terminal resistance invalid
S3	PROFIBUS-DP station address setting button: ten
S4	PROFIBUS-DP station address setting button: one
D1	PROFIBUS-DP diagnostic lights (red): Keep on: PROFIBUS-DP communication offline; Flicker (frequency 1Hz): configuration failure Flicker (frequency 2Hz): parameters configuration failure Flicker (frequency 4Hz): ASIC initialization failure; Off: PROFIBUS-DP communication online and trouble-free.
D2	PROFIBUS-DP communication On-Line status indicators (green): On: online Off: offline
CN7, CN8	Reserved
CN9	PROFIBUS-DP communication interface

Scope of PROFIBUS-DP communication rate is from 9.6Kbps to 1.5Mbps, which corresponds to the transmission distance range from 1200m to 200m, the corresponding relation is shown below:

Baud rate	Communication length
1.5Mbit/s (default)	200m
500kbit/s	400m
187.5kbit/s	1000m

Baud rate	Communication length
93.75kbit/s	1200m
19.2kbit/s	1200m
9.6kbit/s	1200m

**Note:**

1. PROFIBUS-DP communication card provides two rotary switches (S3, S4) to set the communication address on PROFIBUS-DP network. These two rotary switches of binary are used to set the ones and tens of the communication address. The valid range of the communication address is 0–99. The address modification will be effective immediately, it is recommended to set PROFIBUS-DP address during power-off to prevent accidents.
2. It is necessary to use 150Ω twisted pair cables according to the electric transmission mode of EIA-485 standards.
3. It is necessary to add the terminal resistor to the start terminal and end terminal in the same one PROFIBUS-DP network, the connection mode of the terminal resistor is shown below:

4. The bus transmission baud rate can be identified automatically after the power on of PROFIBUS-DP communication card.

**8.4.3 PROFIBUS-DP software configuration**

“Master-slave” mode is available between the data transmission between the main control module and slave control module and SV-DA200 servo drive is always the slave. In real-time control, the cycle data is used for the command setting and state monitoring and the non-cycle communication function is used for the diagnosis and troubleshooting of the data transmission.

The drive control needs parameter and process data. The non-cycle data is used to control commands and drives. The process data is cycle data for servo drive control. SV-DA200 only supports PROFIBUS-DP V0 protocol version (support PKW+PZD mode) and PPO type 5. DP-V0 is the basic communication protocol version and only supports cycle data exchange (MS0 communication). It has the basic configuration for parameters definition and diagnose.

PROFIBUS cycle transmission message applies 32 Byte transmission modes and the data format is as below:

0–7 (Byte)	8–31 (Byte)
PKW	PZD

Of which, PKW is used for the transmission of non-cycle data for the configuration of drive parameters and for the read-write operation. PZD is used in the transmission of cycle data, such as control word, speed command, position command, torque command or state word, speed response, position response, torque response; PZD data can be used for the data of transmission configuration parameters.

**PKW message format:**

PKW								
PKW number(Byte)	1	2	3	4	5	6	7	8
	PKE		IND*1		PWE			

\*1 IND is the communication ID (the same as Modbus address), PWE is the parameter value.

**Format of PKE message:**

PKE																	
Bit	15	14	13	12	11		10	9	8	7	6	5	4	3	2	1	0
	AK (task or response identification ID)				SPM (reserved as 0)			Reserved									

**AK task ID:**

Master station → slave station		Slave station → Master station	
Task ID	Function	Positive response ID	Negative response ID
0	No task	0	0
1	Read parameters	1, 2	7
2	Write parameters(single word)	1	7
3	Write parameters(double word)	2	7
13	Write parameters(single word) save EE	1	7
14	Write parameters(double word) save EE	2	7

**PZD message format:**

PZD												
WORD*1	0	1	2	3	4	5	6	7	8	9	10	11
Down	CW	Speed command	Position command*2	Torque command	Reserved	Configuration setting Parameter 1	Configuration setting Parameter 2	Configuration setting Parameter 3				
Up	SW	Speed feedback	Position feedback	Torque feedback	Reserved	Configuration feedback Parameter 1	Configuration setting Parameter 2	Configuration setting Parameter 3				

\*1 the length of WORD is 16bit.

\*2 the fixed content of PZD is: the position command is P4.12; the speed command is P4.13; the torque command is P4.14, the speed feedback is R0.21, the position feedback is R0.02 and the torque feedback is R0.06.

The meaning of each bit in CW (control word) is listed below:

Bit	Function	Abbreviation in English
0	Control mode switching	MODE_SWITCH
1	Gain switching	GAIN_SWITCH
2	Inertia ratio switching	JRATIO_SWITCH
3	Torque limit switching	TRQLIMIT_SWITCH
4	Zero speed clamp	ZCLAMP
5	Retention pulse clearing	POSERR_CLEAR
6	Vibration control switching input	VIB_SUB
7	Reserved	RESERVED
8	Digital input block (0: CN1 digital input is valid; CN1 digital input is invalid, CW valid)	SERVO_DI_INH
9	Servo enable	SERVO_ON
10	Fault clearing	FAULT_CLEAR
11	Emergency stop	EMEGENCY
12	Positive direction drive disabled	POT(POSITIVE_LIMIT)
13	Negative direction drive disabled	NOT(NEGATIVE_LIMIT)
14	HOME switch signal	HOME_SINGAL
15	HOME trigger	HOME_TRIGGER

\*1 When Bit8 is set to 0, the internal software of the drive will use digital input as the source of the corresponding function; when it is 1, the digital input is shielded and the corresponding control bit is used as the function source.

The meaning of each bit in SW (state word) is listed as below:

Bit	Function	Abbreviation in English
0	Speed matching	SPD_COIN
1	Speed reaching	SPD_AT
2	Speed limiting	SPD_LIMITING
3	Speed command	SPD_CMD_VALID
4	Speed zero output	SPD_ZERO
5	Torque limiting	TRQ_LIMITING
6	Zeroing finished	HOME_END
7	PZD in control	PZD_CONTROLLING
8	Servo ready output *1	READY
9	Servo running output	RUN
10	Fault output	FAULT
11	Alarm output	ALARM
12	Electromagnetic brake release	BREAK_OFF
13	Position command	POS_CMD_VALID
14	Positioning finished	POS_COIN
15	Control mode switching state	MODE_CHANGE_STATUS

**Note:**

1. All used words and double-words are transmitted by the format of **Big-Endian**, which means the

high byte or high word will be transmitted and then the low byte or low word.

2. PZD configuration parameters include setting parameters and feedback parameters for the designated parameter content. The corresponding parameters can be designated by P4.80, P4.81, P4.82, P4.83, P4.84 and P4.85.

3. GSD is a word file for the identification of PROFIBUS-DP device. GSD file includes the data information of a DP slave on the standard DP master station. GSD file has vendor information, supports communication transmission ratio, time information, characters, optional parts and I/O information as the base of master station parameters. The user can download GSD file on the company website for networking.

## 8.5 Upper PC software

### 8.5.1 ServoPlover upper pc software

ServoPlover V4.0 is the PC monitoring and commissioning software of DA200 servo drive with following functions:

1. Real-time monitoring to the state parameters
2. Online modification of the parameters setting
3. To support USB, 4-channel waveform monitoring, the minimum resolution is 0.125ms
4. Bulk parameters saved to folders and downloaded to servo drives
5. Fault display and fault record reading
6. Multiple independent functional application interfaces (for example: frequency feature test, inertia identification, program JOG, ECAM, etc.)

### 8.5.2 Hardware

CPU	Above Pentium 4
Internal storage	More than 1G
Hard disk	More than 512M
Screen resolution	More than 1024*768
Communication interface	USB1.1

### 8.5.3 Software

Operation system	Windows XP, Vista, Windows7
.NET version	.NET Framework 4.0
Excel software	Excel2007, 2010 or above

### 8.5.4 Communication connection

The drive has USB interfaces through which the drive and the computer can be connected. The communication connection is as the figure below:

Connection	Operation	Instruction
Micro USB wire	Standard Micro-USB wire	After power on, the USB wire can connect to the computer and to install the designated drive program

Connection	Operation	Instruction
		

**8.5.5 Software installation and operation**

(The software installation program INVT ServoPolorer V4.0 can be downloaded from <http://www.invt.com/>→Service and Support→Data Download, and the file name is DA200 servo pc tool) During installation, automatically detect whether the user computer needs necessary plug-ins and pop up corresponding prompt messages. Ensure the software and hardware configuration of the computer meets the requirements in 8.5.2 and 8.5.3 before using.

The USB device drive program of the drive is in the drive folder in the directory of software installation (path: ..\ServoPolorer\Drive\USB drive). If necessary, the operation procedures for installing drive program in manual are as follows: My computer → Hardware device manager → Update drive program → Open the folder where drive program is → Select the folder labeled in the red box below

名称 ▲	大小	类型
amd64		文件夹
ia64		文件夹
license		文件夹
x86		文件夹
dirs	1 KB	文件
installer_x64.exe	25 KB	应用程序
installer_x86.exe	23 KB	应用程序
kinwayUSB.inf	8 KB	安装信息

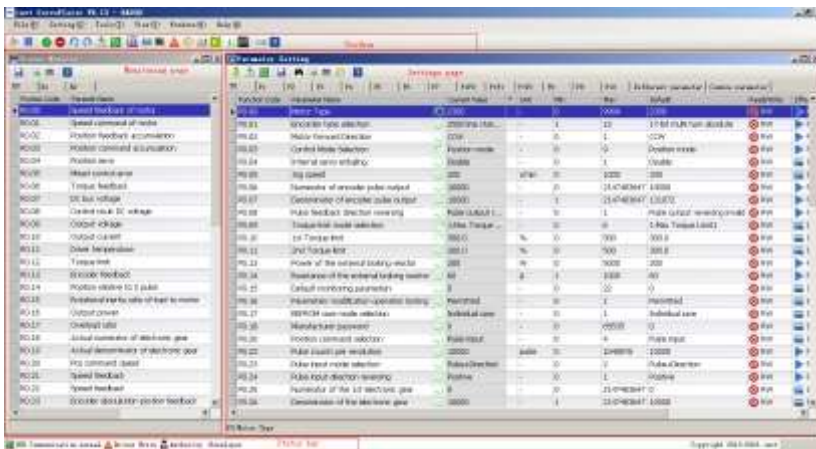

When starting ServoPolorer software, double click ServoPolorer.exe in the directory of software installation as follows:

After starting the program, pop up a start-up interface and then the main interface of the software.

**8.5.6 Program interface**

The main interface includes four parts:

1. Menu bar and Tool strip, all kinds of interface and function of the entrance
2. Condition monitoring page on the left of main interface is used to monitor real-time feedback of status parameters
3. The parameter settings page on the right of main interface is used to modify the setting parameters
4. Display the current communication mode, communication condition, fault status and the information such as user permissions

**8.5.7 Parameter setting**

1. Find the line to the parameters to be modified in the parameter setting interface
2. Click the current value twice, if the permission is allowed, the corresponding bar will appear and then input right value
3. Send the modified parameters to the drive by two methods
  - a. Press carriage return at the edition window
  - b. Click the sending button [  ]

⚙️ P0.03	Control Mode Selection	🔄 Position mode
P0.00	Motor Type	2300

### 8.5.8 Help file

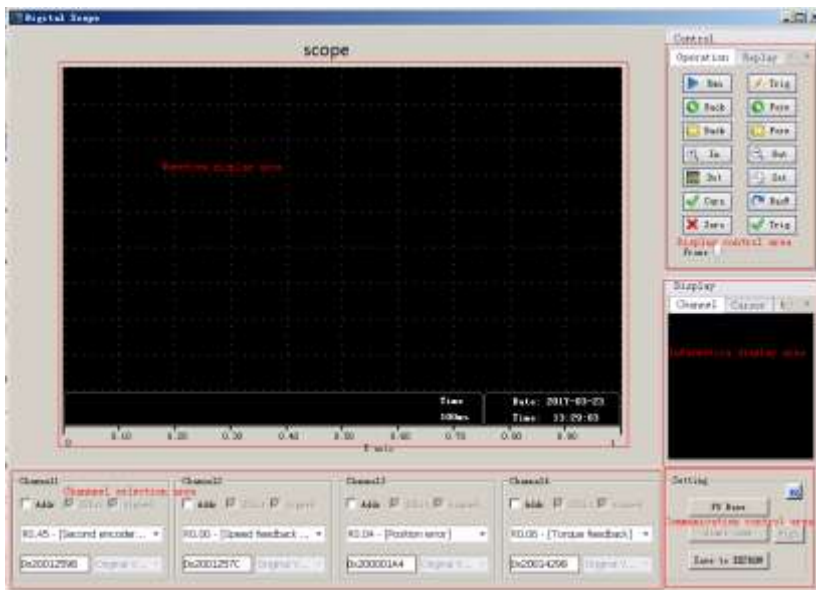

The software has the help file of chm format, including the operation instruction and detailed parameter information for the corresponding help.

The main window has the access to general documentation and the help button of each window can lead the user to relative chapter.

### 8.5.9 Oscilloscope

The oscilloscope function can be started by the oscilloscope button or the route of menu bar → tool → oscilloscope.

#### User interface

There are five areas:

1. Waveform display area: Draw waveform and auxiliary display elements, such as the cursor, gain, etc.
2. Channel selection area: Choose the display content of the channel monitoring, support parameter selection and two modes of the internal variable function codes
3. Display control area:
  - a. Operating interface: Control the starting, stopping, moving and magnifying of the oscilloscope waveform and the displaying of the cursor, zero and trigger threshold;
  - b. Page replay interface: Be used in the USB trigger mode and waveform file restoring mode,

including the function of starting, stopping, and moving and position selection;

c. File operations interface: Saving and restoring of csv waveform file and the figures;

4. Communication control area: Control the starting and stopping of the oscilloscope communication, saving of the channel data, switching of the high-speed and low-speed oscilloscope (valid in the USB mode), setting in the trigger mode and help.

5. Information display area: Display the name of the current monitored content, display or hide the result and so on.

## 9 Faults and solutions

### 9.1 Meanings of the fault alarm code and countermeasures

Code	Name	Causes	Countermeasures
Er01-0	IGBT fault	The actual output current exceeds the specified value 1. Drive fault (drive circuit, IGBT fault); 2. Short circuit of motor cable U, V, W, or the motor cable is grounded or connected improperly; 3. Motor burn down; 4. Reverse sequence of U, V, W phase; 5. Parameters are inappropriate and cause system divergence. 6. ACC/DEC of start/stop process is too short; 7. Instantaneous load is too large.	1. Remove the motor cables and enable the drive, if the fault persists, replace the drive; 2. Check the motor cables and wiring 3. Reduce the value of P0.10 and P0.11; 4. Commission the loop parameters to stabilize the system and reduce the value of P0.12; 5. Increase the ACC/DEC time; 6. Replace with the drive with larger power; 7. Replace the motor.
Er01-1	Brake tube fault (7.5kW and above models)	Brake unit fault	Replace the drive
Er02-0	Encoder fault– The encoder cable broken	1. The encoder is not connected; 2. The encoder connector becomes loose; 3. One of U, V, W, A, B Z phase cables is broken; 4. Reversed A/B phase of the encoder; 5. Communication break or abnormal data caused by noise; 6. Normal encoder communication but abnormal communication data; 7. FPGA communication overtime 8. The drive does not support the encoder type.	1. Check the encoder connector or replace the encoder cable if the cable is disconnected; 2. Detect whether encoder power voltage is normal; 3. Reduce the interference of the encoder, route the encoder and motor independently and connect the shielded cables of the encoder to FG; 4. If reporting encoder disconnection fault when power on, check whether the available drive encoder type is consistent with the available motor encoder type according to P0.01.
Er02-1	Encoder fault–Encoder feedback error is too large		
Er02-2	Encoder fault– Parity error		
Er02-3	Encoder fault–CRC check error		
Er02-4	Encoder fault–Frame error		
Er02-5	Encoder fault–Short frame error		
Er02-6	Encoder fault– Encoder overtime		
Er02-7	Encoder fault –FPGA overtime		

Code	Name	Causes	Countermeasures
Er02-8	Encoder fault –Low voltage alarm of the encoder	If multi-turn encoder is used, the battery voltage of the external encoder is between 3.0V–3.2V	<ol style="list-style-type: none"> <li>1. Check the battery connection in encoder cable;</li> <li>2. Check whether the external battery voltage of encoder is below 3.2V, if yes, change the battery;</li> <li>3. Change the battery when the drive is power on; otherwise the encoder data will be lost.</li> </ol>
Er02-9	Encoder fault –Undervoltage alarm of the encoder battery	If multi-turn encoder is used, the battery voltage of the external encoder is between 2.5V–3.0V.	<ol style="list-style-type: none"> <li>1. Check the battery connection in the encoder cable;</li> <li>2. Check whether the voltage is below 3.0V, if yes, change the battery;</li> <li>3. Change the battery when the drive is power on; otherwise the encoder data will be lost.</li> </ol>
Er02-a	Encoder fault –Encoder over-temperature	The feedback encoder temperature is higher than the set over-temperature value	<ol style="list-style-type: none"> <li>1. Check the setting value of the over-temperature protection value;</li> <li>2. Stop the motor and reduce the encoder temperature.</li> </ol>
Er02-b	Encoder fault–EEPROM write-in error	If the motor is used with communication encoder, and when the drive updates the data to encoder EEPROM, there is communication transmission error or data check error.	<ol style="list-style-type: none"> <li>1. Check the encoder connection and reduce the interference to encoder communication;</li> <li>2. Write in for several times or change the motor.</li> </ol>
Er02-c	Encoder fault–EEPROM no data	If the motor is used with communication encoder, and when read encoder EEPROM during power on, there is no data.	<ol style="list-style-type: none"> <li>1. Select the current motor model through P0.00 and then carry out the encoder EEPROM writing through P4.97;</li> <li>2. Block the fault by P4.98, and then carry out corresponding initialization with the motor parameters in EEPROM.</li> </ol>
Er02-d	Encoder fault–EEPROM data check error	If the motor is used with communication encoder, and when read encoder EEPROM during power on, there is data check error.	<ol style="list-style-type: none"> <li>1. Check the encoder connection and reduce the encoder interference;</li> <li>2. Select the current motor model through P0.00 and then carry out the encoder EEPROM writing through P4.97;</li> </ol>

Code	Name	Causes	Countermeasures
			3. Shield the fault by P4.98, and then carry out corresponding initialization to the motor parameters.
Er03-0	Current sensor fault—U phase current sensor fault	1. Current sensor or abnormal detection circuit; 2. Power on when the motor shaft is in a state of non-stationary.	Repower on when the motor is in static state or change the drive
Er03-1	Current sensor fault—V phase current sensor fault		
Er03-2	Current sensor fault—W phase current sensor fault		
Er04-0	System initialization fault	The self-inspection is not passed after initialization.	1. Repower on; 2. If the fault occurs for several times, change the drive.
Er05-1	Setting fault— Motor model does not exist	Wrong P0.00 setting	1. Ensure the motor model is set correctly; 2. Ensure the motor parameter model matches with the power class of the drive.
Er05-2	Setting fault—Motor and drive model does not match		
Er05-3	Setting fault— Software limit setting error	Software limit values setting is improper. The setting value of P0.35 is less than or equal to the setting value of P0.36.	Reset P0.35 and P0.36.
Er05-4	Setting fault—return to homing mode setting fault	Mode of P5.10 is set incorrectly.	Set P5.10 according to the instructions.
Er05-5	Setting fault— Point control travel overflow fault	The signal increment of idle travel of the bit exceeds $2^{31}-1$ .	The single travel cannot exceed $2^{31}-1$ in the absolute position mode
Er07-0	Regeneration of discharge overload fault	1. The power of the built-in braking resistor is relatively low; 2. The motor speed is too high or the deceleration is too fast; 3. The action limit of the external braking resistor is restricted to 10% of the duty ratio.	1. Replace with an external braking resistor and increase the power; 2. Modify the deceleration time and reduce regeneration discharge action rate; 3. Reduce the motor speed; 4. Improve the capacity of the motor and drive.

Code	Name	Causes	Countermeasures
Er08-0	Analog input overvoltage fault— Analog input 1	The voltage inputted to analog input 1 port exceeds the setting value of P3.22.	1. Set P3.22, P3.25, P3.75 correctly; 2. Check the terminals wiring; 3. Set P3.22, P3.25, P3.75 to 0 to disable the protection function.
Er08-1	Analog input overvoltage fault— Analog input 2	The voltage inputted to analog input 2 port exceeds the setting value of P3.25	
Er08-2	Analog input overvoltage fault— Analog input 3	The voltage inputted to analog input 3 port exceeds the setting value of P3.75	
Er09-0	EEPROM fault— Read-write fault	1. The data stored in data storage area is damaged when reading data from EEPROM 2. There is interference to EEPROM write operation	1. Try again after repower on; 2. If the problem reoccurs for many times, change the drive.
Er09-1	EEPROM fault— data check fault	1. The data read from EEPROM when power on is different from that during writing; 2. The drive DSP software version updates.	1. Reset all parameters; 2. If the problem reoccurs for many times, change the drive.
Er10-0	Hardware fault— FPGA fault	FPGA chip fault	1. Repower on; 2. If the problem reoccurs for many times, change the drive.
Er10-1	Hardware fault— Communication card fault	External communication card fault	1. Repower on 2. If the problem reoccurs for many times, change the communication card
Er10-2	Hardware fault— Ground short circuit fault	During the earth test after power on, one of motor cables V, W is short-circuited to the ground	1. Check the connection of the motor cables; 2. Change the motor cable or test whether the motor insulation aging or not.
Er10-3	Hardware fault— External input fault	This fault occurs when the digital terminal configured as external fault input function acts.	1. Clear the external fault input and enable fault clearance; 2. Repower on the drive
Er10-4	Hardware fault— Emergency stop fault	This fault occurs when the digital terminal configured as emergency stop button acts.	1. Clear the emergency stop input and enable fault clearance; 2. Repower on the drive
Er10-5	Hardware fault— 485 communication fault	Strong EMI of 485 communication circuit causes drive serial communication alarms	1. Use twisted shielded pairs for 485 communication; 2. Wiring communication cables and

Code	Name	Causes	Countermeasures
			motor power cables separately.
Er11-0	Software fault– Reentry of motor control mission	1. CPU loading ratio is too high 2. DSP software fault	1. Reduce the software function; 2. Contact the customer service and change the DSP software.
Er11-1	Software fault– Reentry of cycle mission		
Er11-2	Software fault - Illegal operation		
Er12-0	IO fault– Digital input distribution repeated	Two or more digital inputs are configured to the same functions	Reset P3.00–P3.09 and ensure there is no repeated setting.
Er12-1	IO fault–Analog input distribution repeated	If the drive is standard, the analog input 3 is speed command	Set P3.70 to other value.
Er12-2	IO fault–Pulse input frequency is too high	The pulse input frequency detected by the drive is higher than the designated value 1. External input pulse signal frequency is too high. 2. Damage of internal drive pulse frequency detection circuit	1. Reduce the external input pulse signal frequency; 2. Change the drive if fault occur when external input signal is normal.
Er13-0	Main circuit overvoltage fault	The DC voltage of the main circuit is higher than the designated value 1. The grid voltage is too high; 2. No braking resistor or pipe during braking or the braking resistor is damaged; 3. DEC time is too short during the stopping; 4. The internal DC voltage test circuit is damaged	1. Check whether the grid input voltage exceeds the allowed value; 2. Check whether the internal braking resistor is loose or damaged; check whether external braking resistor is damaged; 3. Enlarge the setting value of ACC/DEC time; 4. Monitor R0.07 when the drive is disabled, if it is abnormal and does not match with grid input voltage, change the drive.
Er13-1	Main circuit undervoltage fault	The DC voltage of the main circuit is less than the designated value 1. The grid voltage is too low; 2. The buffer relay is not switched on; 3. The drive output power is too large; 4. The internal DC voltage test circuit is damaged	1. Check whether the grid input voltage is lower than the allowed value; 2. Repower on, and check whether there is pull-in noise of the relay; 3. Monitor R0.07 when the drive is disabled, if it is abnormal and does not match with grid input voltage, change the drive.

Code	Name	Causes	Countermeasures
Er14-0	Control circuit undervoltage fault	The DC voltage of the control power is less than the designated value 1. The grid voltage is too low; 2. The internal control power DC voltage test circuit is damaged.	1. Check whether the grid input voltage is lower than the allowed value; 2. Monitor R0.08 when the drive is disabled, If it is abnormal and does not match with grid input voltage, change the drive.
Er17-0	Drive overload fault	Short-time load of the drive is too heavy	1.The load is too heavy which causes drive overload; 2.Check whether phase dislocation or phase loss occurred to UVW wiring of the motor, and check whether encoder is correct; 3.Check whether the motor is compatible with the drive.
Er18-0	Motor overload fault	1. Long-term overload running; 2. The load is too heavy during short time.	1. Replace with the drive and motor with larger power.
Er18-1	Motor overtemperature fault	Motor temperature exceeds the protection value	Replace with the motor of larger power;
Er19-0	Speed fault– Overspeed fault	The absolute value of the motor speed exceeds the setting value of P4.32 1. U, V, W phases of the motor are connected reversely; 2. Incorrect setting of the electronic gear ratio or motor speed loop control parameters; 3.The setting value of P4.32 is less than the setting value of P4.31 (max. speed limit); 4. Interference to the encoder feedback signal.	1. Check the electronic gear ratio; 2. Check the setting of speed loop control parameters; 3. Check that the phase sequence of the motor cable are connected correctly; 4. Check whether motor encoder connection is proper; 5. Replace with the motor with higher rotation speed.
Er19-1	Speed fault-FWD overspeed fault	Speed feedback exceeds the value of P4.40 by more than 20ms.	1.Check whether encoder is normal; 2.Check whether P4.40 parameter is set properly.
Er19-2	Speed fault-REV overspeed fault	Speed feedback exceeds the value of P4.41 by more than 20ms.	1.Check whether encoder is normal; 2.Check whether P4.41 is set properly.

Code	Name	Causes	Countermeasures
Er19-3	Speed fault-Overspeed parameter setup is wrong	The value of P4.40 is less than 0 or P4.41 is larger than 0.	1. Check whether encoder is connected reliably; 2. Check whether P4.40 and P4.41 are set improperly.
Er20-0	Speed deviation fault	In non-torque mode, the deviation between motor speed and speed command exceeds the set value of P4.39 1. U, V, W phases of the motor are connected reversely or motor cable is not connected. 2. The motor load is so heavy that it causes motor stall 3. Insufficient drive force that causes motor stall 4. Speed loop control parameters setting is improper 5. The set value of P4.39 is too small.	1. Check the phase sequence of motor cable and ensure right wiring; 2. Check whether the conveyer belt or chain or the workbench reaches the boundary or encounters obstacles; 3. Check whether the loop control parameters are set correctly or the drive is damaged or servo system model is proper; 4. Enlarge the setting value of P4.39 5. Set P4.39 to 0 to disable speed deviation fault detection.
Er21-0	Position overtravel-FWD overtravel	Under position mode, the FWD limit switch is touched or the accumulated feedback pulse exceeds P0.35.	1. Check whether FWD limit switch signal is correct; 2. Check whether P0.35 is set properly.
Er21-1	Position overtravel-REV overtravel	Under position mode, the FWD limit switch is touched or the accumulated feedback pulse exceeds P0.36.	1. Check whether REV limit switch signal is correct; 2. Check whether P0.36 is set properly.
Er22-0	Hybrid control deviation is too large	1. Server response time is too slow, causing retention pulse number to exceed the setting value of P4.33; 2. The motor load is too heavy to cause motor stall; 3. The pulse input frequency is too high and exceeds the max. speed of motor; 4. Position command input step change exceeds the setting value of P4.33.	1. Check whether the conveyer belt or chain or the workbench reaches the boundary or encounters obstacles; 2. Enlarge the position loop gain parameters or speed feedforward gain or P4.33; 3. Adjust the electronic gear ratio parameter; 4. Decrease the variation of position command input.

Code	Name	Causes	Countermeasures
Er22-1	Position increment overflow fault	In fully-closed loop control, the deviation between the feedback position of linear encoder and that of the encoder exceeds the setting value of P4.64	1. Check the connection between the motor and load; 2. Check the connection between linear encoder and the drive; 3. Check the setting of P4.60, P4.61 and P4.62.
Er22-2	Position increment overflow fault	The position command of single variation after converting via electronic gear ratio exceeds ( $2^{31}-1$ ).	1. Decrease the single variation quantity of position command; 2. Modify the gear ratio to a proper range.
Er23-0	Drive over-temperature fault	1. The ambient temperature of the drive exceeds the designated value; 2. Drive overload.	1. Reduce the ambient temperature and improve the ventilation environment; 2. Replace with a servo system with larger power; 3. Prolong the ACC/DEC time and reduce the load.
Er25-4	Application fault—Encoder offset angle test failed	Abnormity occurred during encoder offset angle test.	Check whether the motor shaft can rotate freely, then repower on and carry out.
Er25-5	Application fault—Encoder offset angle test failed	The current feedback wave fluctuate violently during encoder offset angle test	Reduce P4.53 parameter setting, then repower on and carry out.
Er25-6	Application fault—Offside of homing	Encounter the limit switch or software limit during homing	Modify the setting of P5.10, repower on and carry out.
Er25-7	Application fault—Inertia identification failed	1. Vibration in stopping exceeds 3.5s; 2. Too short ACC time; 3. The identification speed is below 150r/min.	1. Improve the mechanical rigidity properly; 2. Increase P1.07; 3. Increase P1.06.

## 9.2 CANopen communication fault code and countermeasures

Code	Name	Causes	Countermeasures
Er22-3	Sync signal overtime	Under interpolation position mode, the time interval between the two neighboring sync frame signals exceeds twice of the communication time cycle.	1. Check communication cable to improve communication reliability; 2. Check whether the generation interval of sync frame of sync signal generation source is correct.

Code	Name	Causes	Countermeasures
Er22-4	Position command buffer is full	CANopen PTP position command buffer is full.	Prolong the time interval of PTP position command transmission
Er26-0	CANOpen disconnection	The master does not receive the heartbeat message from the slave during a period of time	Check the communication wiring.
Er26-1	SDO index does not exist	SDO read or write parameters, the corresponding index does not exist or is not supported	Check the index and modify EDS file
Er26-2	SDO sub index does not exist	SDO read or write parameters, the corresponding sub index does not exist or is not supported	Check the index and modify EDS file
Er26-3	SDO data length error	The length of SDO read or write command does not match with the data length in drive object dictionary.	Adjust the length of SDO R/W command according to the data length of drive object dictionary
Er26-4	SDO write data exceeds the range	The range of SDO write command exceeds the data range of drive object dictionary	Adjust written data of SDO according to the data range in object dictionary.
Er26-5	Read-only and non-modifiable	Modify the read-only parameters	Check whether the parameter to be written is read-only data.
Er26-6	PDO mapping length error	The mapping length of PDO data exceed 64 bit	Check the mapping length of PDO
Er26-7	PDO mapping data does not exist	PDO mapping data cannot be found in the object dictionary	Check PDO mapping data in the object dictionary
Er26-8	PDO not allowed to be changed in the operating	Modify the PDO mapping during operation	Switch CANOpen state to pre-workbench and then modify PDO mapping
Er26-9	PDO not allow the mapping	Map the parameters not allowed into PDO	Check whether there are read-only PDO parameters being mapped into RPDO.
Er26-a	Sync signal is too fast	The received frame exceeds the range allowed by baud rate	1.Modify the interval of data frame transmission via master station or the interval of synchronization frame; 2.Modify communication baud rate.
Er26-b	Receiving fault	CAN communication offline or the received error exceed 128	1.Check communication wiring; 2.Restart the servo drive.
Er26-c	Transmission fault	CAN communication offline or received error exceed 128	1.Check communication wiring; 2.Restart the servo drive.

Code	Name	Causes	Countermeasures
Er26-d	Sync signal repeat	Receive the synchronization signal of external input when synchronization signal is from slave station	Modify the configuration and ensure only there is only one synchronization signal generation source in one communication network.
Er26-e	Bus load rate is too high	In asynchronous work mode, the number of frames received by the slave exceeds the scope allowed by baud rate	1. Modify the interval of data frame transmission via master station; 2. Modify the transmission mode of slave station TPDO; 3. Modify communication baud rate.
Er26-f	Parameter modification state error	Modify the parameter in the state not allowed	Adjust the CANopen machine to Pre-OP or OP state, and then try to modify the parameters

### 9.3 PROFIBUS-DP communication fault code and countermeasures

Code	Name	Causes	Countermeasures
Er24-0	PWK ID error	PWK ID error	Read the manual , ensure the ID of PWK corresponds to the parameter ID
Er24-1	PWK exceed the range	The setting of PWK exceed the range allowed by the corresponding parameter	Read the manual , ensure the PWK setting of PWK is in the range allowed by the corresponding parameter
Er24-2	Read-only PWK parameter	PWK parameter performs write operation to read-only parameters.	Read the manual , ensure the parameter can be read and written
Er24-3	PZD configuration parameter does not exist	The selected ID is not right	Read the manual , ensure the ID corresponds to the corresponding parameter ID
Er24-4	PZD configuration parameter does not matching	The parameter is not valid instantly	Read the manual , ensure the parameter is valid instantly

### 9.4 EtherCAT communication fault code and countermeasures

Code	Name	Cause	Countermeasures
Er24-8	Initialization fault	Poor contact of EtherCAT chip	Replace the servo
Er24-9	EEPROM fault	EtherCAT EEPROM has no data or data reading failed.	Use TwinCAT tool to download xml file to EtherCAT EEPROM;

Code	Name	Cause	Countermeasures
Er24-a	DC Sync0 signal abnormal	DC Sync0 interruption signal is not detected during a period of time under DC sync working mode.	Check whether interruption causes data loss; Check whether EtherCAT master can work normally;
Er24-b	Disconnection fault	After the drive is enabled, the network cable is detected to be inserted improperly or EtherCAT master is running improperly.	Check whether network cable is connected properly, the connection mode of network cable is top-in and bottom-out; Check interferences; Check whether EtherCAT master can work properly.
Er24-c	PDO data loss fault	No PDO data is received after the drive is enabled for a period of time.	Check whether EtherCAT master works properly; Check whether interference causes data loss.

# 10 Appendix

## 10.1 Setup parameter list

P – position mode; S – speed mode; T – torque mode;

The function codes with the superscript of “1” indicate that these parameters can be valid only when the system is reset and restarted or repowered after disconnection.

The function codes with the superscript of “2” indicate that these parameters are valid when the servo drive stops. The modification during operation is invalid.

The function codes with the superscript of “\*” indicate that these parameters are not saved after power off.

Function code	Name	Unit	Range	Default	Available Mode
<b>P0 Basic control</b>					
P0.00 <sup>1</sup>	Motor model	-	0–9999999	236	PST
P0.01 <sup>1</sup>	Encoder type	-	1–12	4	PST
P0.02 <sup>1</sup>	Forward rotation of motor	-	0–1	0	PST
P0.03 <sup>1</sup>	Control mode selection	-	0–9	0	PST
P0.04*	Internal enabling command	-	0–1	0	PST
P0.05	JOG speed	r/min	0–1000	200	PST
P0.06 <sup>1</sup>	Numerator of frequency division output coefficient	-	0–(2 <sup>31</sup> -1)	10000	PST
P0.07 <sup>1</sup>	Denominator of frequency division output coefficient	-	1–(2 <sup>31</sup> -1)	131072	PST
P0.08 <sup>1</sup>	Reverse of frequency division output	-	0–1	0	PST
P0.09	Torque limit mode setting	-	0–6	1	PS
P0.10	Max torque limit 1	%	0.0–500.0	300.0	PST
P0.11	Max torque limit 2	%	0.0–500.0	300.0	PS
P0.13 <sup>1</sup>	Power of the external braking resistor	W	0–5000	200	PST
P0.14 <sup>1</sup>	Resistance of the external braking resistor	Ω	1–1000	60	PST
P0.15	Default monitoring parameters	-	0–22	0	PST
P0.16	Parameter modification operation locked	-	0–1	0	PST
P0.17	EEPROM write mode	-	0–1	0	PST
P0.18*	Factory password	-	0–65535	0	PST

Function code	Name	Unit	Range	Default	Available Mode
P0.20 <sup>1</sup>	Position command selection	-	0–4	0	P
P0.22 <sup>1</sup>	Pulse number per motor resolution	reference unit	0–(2 <sup>31</sup> -1)	10000	P
P0.23 <sup>1</sup>	Pulse input form	-	0–2	0	P
P0.24 <sup>1</sup>	Reverse of pulse input direction	-	0–1	0	P
P0.25	Numerator of 1 <sup>st</sup> electronic gear ratio	-	0–(2 <sup>31</sup> -1)	0	P
P0.26 <sup>2</sup>	Denominator of electronic gear ratio	-	1–(2 <sup>31</sup> -1)	10000	P
P0.27	Numerator of 2 <sup>nd</sup> electronic gear ratio	-	0–(2 <sup>31</sup> -1)	0	P
P0.28	Numerator of 3 <sup>rd</sup> electronic gear ratio	-	0–(2 <sup>31</sup> -1)	0	P
P0.29	Numerator of 4 <sup>th</sup> electronic gear ratio	-	0–(2 <sup>31</sup> -1)	0	P
P0.33 <sup>2</sup>	Smooth filtering of position command	ms	0.0–1000.0	0.0	P
P0.34 <sup>2</sup>	FIR filtering of position command	ms	0.0–1000.0	0.0	P
P0.35	Software limit of forward position control	reference unit	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	0	P

## 10.2 Monitoring parameter table

The state monitoring parameter of the servo drive is shown below:

Function code	Name	Unit	Range	Available Mode
<b>R0 System monitoring parameter</b>				
R0.00	Motor speed	r/min	-9999.9–9999.9	PST
R0.01	Speed command	r/min	-9999.9–9999.9	PST
R0.02	Feedback pulse accumulation	reference unit	$-(2^{63}-1)-(2^{63}-1)$	P
R0.03	Command pulse accumulation	reference unit	$-(2^{63}-1)-(2^{63}-1)$	P
R0.04	Retention pulse	reference unit	$-(2^{31}-1)-(2^{31}-1)$	P
R0.05	Hybrid control deviation	reference unit	$-(2^3-1)-(2^{31}-1)$	P
R0.06	Current torque	%	-500.0–500.0	PST
R0.07	DC voltage of main circuit	V	0.0–1000.0	PST
R0.08	Voltage of control power	V	0.0–1000.0	PST
R0.09	Output voltage	Vrms	0.0–1000.0	PST
R0.10	Output current	Arms	0.0–1000.0	PST
R0.11	Drive temperature	°C	-55.0–180.0	PST
R0.12	Torque limit	%	-500.0–500.0	PST
R0.13	Encoder feedback value	pulse	$0-(2^{32}-1)$	PST
R0.14	Rotor relative to Z pulse position	pulse	$0-(2^{31}-1)$	PST
R0.15	Inertia ratio of load	%	0–10000	PST
R0.16	Output power	%	-500.0–500.0	PST
R0.17	Motor load ratio	%	0–500	PST
R0.18	Molecule of actual electric gear ratio	-	$0-(2^{31}-1)$	P
R0.19	Denominator of actual electric gear ratio	-	$1-(2^{31}-1)$	P
R0.20	Position command speed	r/min	-9999.9–9999.9	P
R0.21	Motor speed (filtering)	r/min	-9999.9–9999.9	PST
R0.22	PTP state	-	-1–4223	P
R0.23	Feedback of encoder absolute position	pulse	$-(2^{31}-1)-(2^{31}-1)$	PST
R0.24	Encoder EEPROM data state	-	0–3	PST
R0.25	Circles of multi-circle encoder	-	-32768–32767	PST
R0.26	Available encoder type	-	0–6	PST
R0.27	EtherCAT clock synchronous correction state	-	0–1	PST
R0.28	State of CANopen state machine	-	0–18	PST
R0.29	Node of PROFIBUS-DP slave station	-	0–99	PST

Function code	Name	Unit	Range	Available Mode
R0.30	System state	-	0–5	PST
R0.31	IGBT state	-	0–1	PST
R0.32	Current mode	-	0–2	PST
R0.33	Power on time	s	0–(2 <sup>31</sup> -1)	PST
R0.34	Operation time	s	0–(2 <sup>31</sup> -1)	PST
R0.35	DSP software version	-	0.00–10.00	PST
R0.36	FPGA software version	-	0.00–10.00	PST
R0.37	Communication card software version	-	0.00–10.00	PST
R0.38	Drive serial No.1	-	0–65535	PST
R0.39	Drive serial No.2	-	0–65535	PST
R0.40	Drive serial No.3	-	0–65535	PST
R0.41	Drive serial No.4	-	0–65535	PST
R0.42	Drive serial No.5	-	0–65535	PST
R0.43	Drive serial No.6	-	0–65535	PST
R0.44	Absolute position of linear encoder (2 <sup>nd</sup> encoder) in single circle	pulse	0–(2 <sup>31</sup> -1)	PST
R0.45	Speed feedback of 2 <sup>nd</sup> encoder	r/min	-9999.9–9999.9	PST
R0.46	Observing speed of speed observer	r/min	-9999.9–9999.9	PST
R0.47	Feedback speed of speed observer	r/min	-9999.9–9999.9	PST
R0.48	Observing disturbance torque via disturbance observer	%	-1000.0–1000.0	PST
R0.49	Compensation value of fully-closed vibration suppressor	r/min	-9999.9–9999.9	PST
R0.51	Observe load inertia ratio in real time	%	0–10000	PST
R0.52	Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation (32-bit number)	pulse	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	PST
R0.53	Gantry synchronization position deviation	reference unit	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	PST
R0.54	Linear encoder (2 <sup>nd</sup> encoder) position feedback value	pulse	0–(2 <sup>31</sup> -1)	PST
R0.55	Encoder circle number offset after clearing multi-turn position	-	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	PST
R0.56	Encoder feedback value offset after clearing multi-turn position	pulse	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	PST
R0.57	Linear encoder (2 <sup>nd</sup> encoder) position feedback accumulation (64-bit number)	pulse	-(2 <sup>63</sup> -1)–(2 <sup>63</sup> -1)	PST
R0.58	Position inside the single-turn of the disk	pulse	-(2 <sup>31</sup> -1)–(2 <sup>31</sup> -1)	PST

Function code	Name	Unit	Range	Available Mode
R0.60	Temperature of medium-power motor	℃	-55–200	PST
R0.99	Fault code	-	-32768–32767	PST
<b>R1 IO monitoring parameter</b>				
R1.00	Digital input state	-	0x000–0x3FF	PST
R1.01	Digital output state	-	0x00–0x3F	PST
R1.02	Original voltage of analog input 1	-	-10.000–10.000	PST
R1.03	Original voltage of analog input 2	-	-10.000–10.000	PST
R1.04	Original voltage of analog input 3	-	-10.000–10.000	PST
R1.05	Voltage of analog input 1	V	-10.000–10.000	PST
R1.06	Voltage of analog input 2	V	-10.000–10.000	PST
R1.07	Voltage of analog input 3	V	-10.000–10.000	PST
R1.08	Voltage of analog output 1	V	-10.000–10.000	PST
R1.09	Voltage of analog output 2	V	-10.000–10.000	PST
R1.10	Voltage of analog output 3	V	-10.000–10.000	PST
R1.11	Cumulative value of pulse input	reference unit	$-(2^{31}-1)-(2^{31}-1)$	PST
R1.12	Pulse position command	reference unit	$-(2^{31}-1)-(2^{31}-1)$	PST
R1.13	Pulse speed command	r/min	-10000.0–10000.0	PST
R1.14	Analog compensation speed	r/min	-10000.0–10000.0	PST
R1.15	Analog compensation torque	%	-1000.0–1000.0	PST
R1.16	DI capture encoder value	pulse	$-(2^{31}-1)-(2^{31}-1)$	PST
R1.17	Display of drive state bit	-	0–0xFFFFFFFF	PST
<b>R3 Fault record parameter</b>				
R3.00	Fault code record	-	-	PST
R3.01	Power on time when fault occurs	h	$0-(2^{31}-1)$	PST
R3.02	Operation time when fault occurs	h	$0-(2^{31}-1)$	PST
R3.03	Motor speed when fault occurs	r/min	-20000–20000	PST
R3.04	Speed command when fault occurs	r/min	-20000–20000	PST
R3.05	Feedback pulse accumulation when fault occurs	reference unit	$-(2^{63}-1)-(2^{63}-1)$	P
R3.06	Command pulse accumulation when fault occurs	reference unit	$-(2^{63}-1)-(2^{63}-1)$	P
R3.07	Stranded pulse when fault occurs	reference unit	$-(2^{31}-1)-(2^{31}-1)$	P
R3.08	Current torque when fault occurs	%	-500.0–500.0	PST
R3.09	Main circuit DC voltage when fault occurs	V	0.0–1000.0	PST
R3.10	Output voltage when fault occurs	Vrms	0.0–1000.0	PST

<b>Function code</b>	<b>Name</b>	<b>Unit</b>	<b>Range</b>	<b>Available Mode</b>
R3.11	Output current when fault occurs	Arms	0.00–1000.00	PST
R3.20	The last fault record	-	-	PST
R3.21	The last but one fault record	-	-	PST
R3.22	The last but two fault record	-	-	PST
R3.23	The last but three fault record	-	-	PST
R3.24	The last but four fault record	-	-	PST
R3.25	The last but five fault record	-	-	PST
R3.26	The last but six fault record	-	-	PST
R3.27	The last but seven fault record	-	-	PST

R3.29	The last but nine fault record	-	-	PST

### 10.3 General monitoring parameters

Setting value of P0.15	Meaning	Sign	Unit	Corresponding parameter
[0]	Motor rotation speed	SPdFb	r/min	R0.00
1	Speed command	SPdcNd	r/min	R0.01
2	Pulse feedback accumulation	PLSFb	reference unit	R0.02
3	Pulse command accumulation	PLScNd	reference unit	R0.03
4	Retention pulse	PLSEr1	reference unit	R0.04
5	Hybrid control deviation	PLSEr2	reference unit	R0.05
6	Current torque	TrqFb	%	R0.06
7	Main circuit DC voltage	Ubus1	V	R0.07
8	Voltage of control power	Ubus2	V	R0.08
9	Output voltage	UoUt	Vrms	R0.09
10	Output current	IoUt	Arms	R0.10
11	Drive temperature	ndLtnP	°C	R0.11
12	Torque limit	TrqLnt	%	R0.12
13	Encoder feedback value	EncFb	pulse	R0.13
14	Rotor position relative to Z pulse	EncAbs	pulse	R0.14
15	Load inertia ratio	J-r	%	R0.15
16	Output power	Power	%	R0.16
17	Motor load rate	Load-r	%	R0.17
18	Molecule of actual electronic gear	nUN	-	R0.18
19	Denominator of actual electronic gear	dEN	-	R0.19
20	Pulse speed command	PLSSPd	r/min	R0.20
21	Instant speed	SPdFb1	r/min	R0.21
22	PTP state	PEPStS	-	R0.22

## 10.4 Fault code

The format of fault code is ErXX-X, of which, XX is the master code and X is the sub code.

**Example:**  , the master code is 01, the sub code is 0. Other codes are displayed in the similar way.

Fault code	Name	Feature		
		History record	Can be cleared	Disable
Er01-0	IGBT fault	●		●
Er01-1	Brake tube fault (7.5kW and above model)	●		●
Er02-0	Encoder fault–The encoder wire break	●		●
Er02-1	Encoder fault–Encoder feedback error is too large	●		●
Er02-2	Encoder fault–Parity error	●		●
Er02-3	Encoder fault–CRC error	●		●
Er02-4	Encoder fault–Frame error	●		●
Er02-5	Encoder fault–A short frame error	●		●
Er02-6	Encoder fault–Encoder overtime	●		●
Er02-7	Encoder fault–FPGA overtime	●		●
Er02-8	Encoder fault–Low voltage alarm of the encoder			
Er02-9	Encoder fault–Undervoltage alarm of the encoder	●		●
Er02-a	Encoder fault–Encoder over-temperature	●		●
Er02-b	Encoder fault–EEPROM write error	●		●
Er02-c	Encoder fault–EEPROM no data			●
Er02-d	Encoder fault–EEPROM data check error			●
Er03-0	Current sensor fault–U phase current sensor fault	●		●
Er03-1	Current sensor fault–V phase current sensor fault	●		●
Er03-2	Current sensor fault–W phase current sensor fault	●		●
Er04-0	System initialization fault			●
Er05-1	Setting fault–Motor model does not exist	●		●
Er05-2	Setting fault–Motor and drive model does not match	●		●
Er05-3	Setting fault–Software limit setting error	●	●	●
Er05-4	Setting fault–Homing mode setting fault	●	●	●
Er05-5	Setting fault–Bit control travel overflow fault	●	●	●
Er07-0	Regeneration discharge overload fault	●	●	●
Er08-0	Analog input overvoltage fault–Analog input 1	●	●	●
Er08-1	Analog input overvoltage fault–Analog input 2	●	●	●
Er08-2	Analog input overvoltage fault–Analog input 3	●	●	●

Fault code	Name	Feature		
		History record	Can be cleared	Disable
Er09-0	EEPROM fault–Read-write fault			●
Er09-1	EEPROM fault–data check fault			●
Er10-0	Hardware fault–FPGA fault	●		●
Er10-1	Hardware fault–Communication card fault	●	●	●
Er10-2	Hardware fault–Grounding short circuit fault	●		●
Er10-3	Hardware fault–External input fault	●	●	●
Er10-4	Hardware fault–Emergency stop fault	●	●	●
Er10-5	Hardware fault–485 communication fault	●	●	●
Er11-0	Software fault–Motor control task re-entry	●		●
Er11-1	Software fault–Reentrant cycle mission	●		●
Er11-2	Software fault–Illegal operation	●		●
Er12-0	IO fault–Digital input distribution repeated	●	●	●
Er12-1	IO fault–Repetitive analog input distribution	●	●	●
Er12-2	IO fault–Pulse input frequency is too high	●	●	●
Er13-0	Main circuit overvoltage fault	●	●	●
Er13-1	Main circuit undervoltage fault		●	●
Er14-0	Undervoltage fault of control power		●	●
Er17-0	Drive overload fault	●		●
Er18-0	Motor overload fault	●	●	●
Er18-1	Motor overtemperature fault	●	●	●
Er19-0	Speed fault–Overspeed fault	●	●	●
Er19-1	Speed fault–FWD overspeed fault	●	●	●
Er19-2	Speed fault–REV overspeed fault	●	●	●
Er19-3	Speed fault- Overspeed parameter setup error	●	●	●
Er20-0	Speed deviation fault	●	●	●
Er21-0	Position overtravel - FWD overtravel		●	
Er21-1	Position overtravel - REV overtravel		●	
Er22-0	Position deviation fault	●	●	●
Er22-1	Hybrid control deviation is too large	●	●	●
Er22-2	Position increment overflow fault	●		●
Er22-3	CANopen fault–Sync signal timeout	●	●	●
Er22-4	CANopen fault-position command buffer full	●	●	●
Er23-0	Drive overtemperature fault	●	●	●

Fault code	Name	Feature		
		History record	Can be cleared	Disable
Er24-0	PROFIBUS-DP fault–PWK parameters ID error		●	
Er24-1	PROFIBUS-DP fault–PWK Parameters exceeds the range		●	
Er24-2	PROFIBUS-DP fault–PWK Parameters are read-only		●	
Er24-3	PROFIBUS-DP fault–PZD Configuration parameter does not exist		●	
Er24-4	PROFIBUS-DP fault–PZD Configuration parameter properties do not match		●	
Er24-8	EtherCAT fault–initialization fault	●		●
Er24-9	EtherCAT fault–EEPROM fault	●		●
Er24-a	EtherCAT fault–DC Sync0 signal is abnormal	●	●	●
Er24-b	EtherCAT fault–Disconnection fault	●	●	●
Er24-c	EtherCAT fault–PDO data loss fault	●	●	●
Er25-4	Application fault–Encoder offset angle test overtime	●	●	●
Er25-5	Application fault–Encoder offset angle test failure	●	●	●
Er25-6	Application fault–Offside of homing	●	●	●
Er25-7	Application fault–Inertia identification failure	●	●	●
Er26-0	CANopen fault–CANopen disconnection		●	
Er26-1	CANopen fault–SDO index does not exist		●	
Er26-2	CANopen fault–SDO sub index does not exist		●	
Er26-3	CANopen fault–SDO data length error		●	
Er26-4	CANopen fault–SDO W data exceeds the scope		●	
Er26-5	CANopen fault–Read-only cannot be modified		●	
Er26-6	CANopen fault–PDO mapping length error		●	
Er26-7	CANopen fault–PDO mapping data does not exist		●	
Er26-8	CANopen fault–PDO is not allowed to be modified during operating		●	
Er26-9	CANopen fault–PDO mapping is not allowed		●	
Er26-a	CANopen fault–Sync signal is too fast		●	
Er26-b	CANopen fault–Receive fault		●	
Er26-c	CANopen fault–Send failure		●	
Er26-d	CANopen fault–Sync signal repeat		●	
Er26-e	CANopen fault–The bus load rate is too high		●	
Er26-f	CANopen fault–Parameter modification state error		●
